**SEXUAL HISTORY, RISK ASSESSMENT & PHYSICAL EXAM**

**Sexual History, Risk Assessment (past year):**
- gender of partners
- number of partners (new, anonymous, serodiscordant HIV status, exchange of sex for drugs or money)
- types of sexual exposure
- recent STDs; HIV serostatus
- substance abuse
- condom use

**History of syphilis**
- prior syphilis (last serologic test & last treatment)

**Physical Exam**
- oral cavity
- lymph nodes
- skin
- palms & soles
- neurologic
- genitalia/pelvic
- perianal

**DIAGNOSTIC ISSUES IN PRIMARY SYPHILIS**

**Darkfield**
- ~80% sensitive, varies with experience/skill of examiner & decreased sensitivity as lesion ages

**RPR/VDRL**
- A negative RPR/VDRL does not exclude the diagnosis of syphilis; only ~75-85% sensitive in primary syphilis
- Tests must be quantified to the highest titer & titer on the day of treatment must be used to assess treatment response
- Always use the same testing method (RPR or VDRL) in sequential testing; cannot compare titer from the two tests
- Tests lack specificity (biologic false positive); all reactive tests need to be confirmed by a treponemal test for syphilis diagnosis

**TREATMENT & FOLLOW-UP**

**Treatment of Primary Syphilis**

**Recommended Regimen**
- Benzathine Penicillin G 2.4 million units IM x 1

**Alternative Regimens for Penicillin Allergic Non-Pregnant Patients:**
- efficacy not well established & not studied in HIV infected; close follow-up essential
- Doxycycline 100 mg po bid x 2 weeks or
- Tetracycline 500 mg po qid x 2 weeks or
- Ceftriaxone 1gm IM or IV qd x 8-10 d

**Follow-Up To Assess Treatment Response**
- 1-2 weeks & 1 month: clinical follow-up
- 3, 6, 9, 12, 24 months: serologic follow-up for HIV infected
- 6, 12 months: serologic follow-up for HIV negative
- Treatment failure: failure of titer to decline fourfold within 6-12 months from titer at time of treatment.

**REPORTING & PARTNER MANAGEMENT**

- All syphilis cases or suspected cases must be reported to the local health department within one working day of diagnosis
- Local health departments will assist in partner notification & management
- Contact Number at Local Health Department
Evaluating Patients For Primary Syphilis (P2/3)

Patient with new genital ulcer or suspicious genital lesion

SEXUAL HISTORY, RISK ASSESSMENT & PHYSICAL EXAM*

DIAGNOSTIC WORK-UP†

• Darkfield (if available)
• Stat RPR (if available)
• RPR or VDRL serology
• TP-PA or FTA-ABS to confirm reactive RPR or VDRL
• Herpes culture¹
• HIV test

Positive

Darkfield

Negative or Not available

Reactive

Stat RPR

Negative or Not available

Risk factors or high clinical suspicion³

No

Wait for serology results

Reactive

TP-PA/FTA-ABS

Negative

Repeat RPR or VDRL 2-4 weeks after first visit to rule out syphilis
• Consider ordering TP-PA or FTA-ABS
• Consider other etiologies (HSV)

Primary Syphilis²:
Treat‡, Follow-up**, Report§ & Partner Management

Presumptive Primary Syphilis²:
Treat‡, Follow-up**, Report§ & Partner Management

Primary Syphilis²:
Treat‡, Follow-up**, Report§ & Partner Management

Repeat RPR or VDRL in 2-4 weeks if no other etiology identified.
• If reactive then repeat TP-PA or FTA-ABS
• If repeat TP-PA or FTA-ABS is negative then RPR/VDRL is biologic false positive
• Consider other etiologies (HSV)

¹, ‡, §, ** see color coded boxes

1. Also consider culture for Haemophilus ducreyi if exposure in endemic areas or if lesion does not respond to syphilis treatment.
2. All patients with suspected syphilis should be tested for HIV infection & screened for other STDs. Repeat HIV testing of patients with primary syphilis 3 months after the first HIV test, if the first test is negative.
3. If the patient is MSM (men who have sex with men) or has high risk sexual behavior (multiple partners, exchange of sex for money or drugs) or clinical exam with classic features of a syphilitic ulcer then presumptive treatment is recommended. Also consider presumptive treatment if patient follow-up is a concern.
Clinical Presentations Of Primary Syphilis

- Lesion appears 10-90 days after contact at site of exposure; may persist for 2-3 weeks then resolves
- Usually genitoreal but may be extragenital, depends on exposure site
- Clinical presentation typical or atypical
  - Typical: single painless, indurated, clean-based ulcer with rolled edges & bilateral painless adenopathy
  - Atypical: can mimic herpes & other genital ulcers
  - ~25% present with multiple lesions

Differential Diagnosis
Herpes, chancroid, primary HIV ulcers, trauma & many non-STD causes of genital ulcers
