Is it teething time for your baby?
Here's what to look for and how to help!

What you need to know!
Baby teeth start growing in around 4 to 6 months old but can appear as late as 12 months. It’s important to remember that teething can cause discomfort, which is normal. If you have concerns about your baby’s symptoms call their dentist or pediatrician.

How to help your baby
- Teething rings and toys – Chewing on a firm rubber teething ring can soothe sore gums
- Use a clean, cold wet washcloth to massage baby’s gums
- Feed your baby cool, soft foods such as applesauce and yogurt
- Give your baby a bottle filled with water, if it seems to help

Common Teething Symptoms
- Fussiness
- Irritability
- Drooling
- Mild fever
- Loss of appetite
- Trouble sleeping

Teething can cause a mild fever of less than 100.4 Fahrenheit. According to the American Dental Association, you should contact your baby’s doctor if your baby has a fever higher than 100.4 Fahrenheit, experiences vomiting, diarrhea, or a rash.

Baby teeth are important. Schedule your baby’s first dental visit when their first tooth appears or by their first birthday, whichever comes first.
