

The Air Liquide Large Industries (Air Liquide Rodeo)

The Air Liquide Large Industries is located in Rodeo, CA. The primary purpose of this facility is to manufacture gaseous hydrogen for the neighboring Phillips 66 Refinery in Rodeo, California, which they use as part of the refinery operation. The plant also produces steam and electricity, sold directly to Phillips 66 Refinery. The plant is designed for using a varying mixture of feed stock. The fuel used for their reformer furnace is natural gas, refinery fuel gas, and off-gas from the hydrogen purification system (PSA).

The Air Liquide Rodeo facility started operation in summer of 2009. This plant has 13 full time employees and operates around the clock with a maximum amount of 78,000 pounds of 19% aqueous ammonia and 25,000 pounds of flammable gas containing 64% hydrogen and 36% methane, by weight, at any given time.

Hazardous Substances Stored or Produced Onsite and their Immediate Health Effects

- Hydrogen: an odorless, extremely flammable gas. Inhalation can cause dizziness, shortness of breath and unconsciousness.
- Aqueous Ammonia: colorless liquid with pungent odor. May cause nausea, breathing difficulty and convulsions. Made by dissolving anhydrous ammonia in water.

3-Year Accident History

(Last updated October 2022)

There have been no incidents to require reporting since the facility began operation in June 2009.

Safety Features and Recent Improvements

(Updated October 2022):

The safety features include modern fire monitors, process safety valves (PSVs), instrumentation including indications, alarms and controls; and inherent design that includes lower concentrations of ammonia (19%) and physical layout of the plant. The site has continued to update and refine their site-specific documents to clarify the ISO requirements.

Summary of Most Recent Audit

(January 2022):

The CalARP Programs were mostly found to be in compliance. The CalARP/Safety Program implementation and management responsibilities between the plant and corporate staff were defined, coordinated and integrated. The facility has strengthened the corporate oversight of the CalARP and ISO program elements and generally completes the related action items in a timely manner. Senior management have allocated time and resources for the Safety Program elements including those for the County Industrial Safety Ordinance (ISO). Improvements are needed in establishing expertise in the following: Inherently Safer Systems (ISS) and Safety Culture Assessment program.

Some of the ISO Program requirements need improvement. The action items include improvements needed in developing expertise in Human Factors; reviewing of all operating and maintenance procedure for human factors deficiencies. Improvements are also needed in ensure that PHA actions are targeted to be complete within one year unless a plant shutdown is required; conducting more complete safety culture assessments, and effectively addressing inherently safer systems/design (look for ways to reduce the hazard and make the process safer).
