# Agenda

## Quarterly Community Provider Network (CPN) Meeting

**Contra Costa Health Plan**

**When:** Time: 7:30 AM – 9:00 AM**
**Date:** April 25, 2018

**Where:** Pittsburg Health Center
2311 Loveridge Rd.,
Cypress Conference Room – 1st Floor, #D104
Pittsburg, CA 94565

The agenda for the meeting is as follows:

<table>
<thead>
<tr>
<th>I. CALL TO ORDER and INTRODUCTIONS</th>
<th>Christine Gordon, RN, BSN, DHCS-MT</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Review Online Access to Clinical Guidelines &amp; Preventive Services Information</td>
<td></td>
</tr>
<tr>
<td>II. REVIEW and APPROVAL of Previous Meeting Minutes</td>
<td>Jose Yasul, MD</td>
</tr>
<tr>
<td>Acting Medical Director, CCHP</td>
<td></td>
</tr>
</tbody>
</table>
| III. NEW BUSINESS | Andrew Haydon, Pharm.D  
Pharmacy Director/Staff |
| Debi Marsee, Manager,  
Employment and Human Services Dept.  
Comprehensive Services |
| Christine Gordon, RN, BSN, DHCS-MT |
| IV. DISCUSSION ITEMS | Jose Yasul, MD |
| Acting Medical Director, CCHP |
| • CCHP Updates  
➢ Legislative Update  
➢ Clinical Guidelines  
➢ Preventive Services  
➢ Behavioral Health  
➢ CCHP Benefits Update  
➢ Quality  
➢ Pharmacy  
➢ Utilization Management |
| V. CLAIMS Q&A | Staff |

Our next scheduled meeting is: July 25, 2018 ** CPN meeting reimbursement will be prorated based on length of time attendee is present in the meeting.
CONTRA COSTA HEALTH PLAN  
East County  
Quarterly Community Provider Network (CPN)  
Meeting Minutes – April 25, 2018

Attending:  
CCHP Staff:  
Jose Yasul, MD, Acting Medical Director; Christine Gordon, RN, BSN, DHCS-MT; Alejandro Fuentes, RN; Joe Cardinalli, Pharmacist; Sylvia Rodriguez, Claims Dept. Supervisor; Delaina Gillaspy, Secretary

CPN Providers:  
Christine Cave, NP; Siamak Elyasi, MD; Desiree Espinoza, NP.

Guests:  
Debi Marsee, Head Start

I. Agenda was approved with no revisions.

II. Review Online Access to Clinical Guidelines & Preventive Services Information

- **Behavioral Health**
  - Behavioral Health Access Handout
    - Alcohol and drug abuse treatment contact information.
      - Toll Free: 1-800-846-1652
      - Outside Contra Costa County: 925-335-3310
      - Information Available 24/7 at: [www.cchealth.org/aod](http://www.cchealth.org/aod)
      - All calls are completely confidential.
    - Challenges
      - Making contact for services can be challenging/intimidating for patients.

- **Clinical Guidelines**
  - Reviewed how to access Clinical Guidelines on Contra Costa Health plan website and provided handout to providers.

- **Preventive Services**
  - USPSTF
    - USPSTF A and B recommendations handout provided during meeting.
  - Skin Cancer Prevention: Behavioral Counseling
    - Skin Cancer Prevention: Behavioral Counseling handout provided during meeting.
      - UV Radiation
      - Child/Adult recommendations
III. New Business

Head Start

- **Overview**
  - Federal and State funded program that provides comprehensive services and works with families to receive medical and dental services.
    - Head Start has up to 30 days to have all children enrolled in medical and dental services and will also provide transportation to appointments if needed.
  - Head Start is a free program that is for low income families that are income eligible.
    - Head Start is mandated to serve 10% of children with disabilities and provided with an income eligibility waiver.
  - Head Start will provide assistance to families with medical, dental, homelessness, mental health and continue to follow up with the child/children’s health.
  - Services are provided to undocumented children/families.

- **Services Provided**
  - Childcare
    - Childcare services are provided based on the needs of the family.
      - Non-working- 3 ½ hours provided
      - Working/School- Hours based on need for work, commute time, school and/or study time.
  - Preschool
  - Parenting Classes
  - Behavioral Health
  - Depending on the type of services needed Head Start can provide services at the child/children’s school to assist in eliminating transportation issues for families.
  - Bilingual Services
  - Homes Based system for children that are unable to leave the home.

- **Forms Included in packet**
  1. Report of Health Examination- Well Child Check
  2. Individualized Health Plan Routine Care
  3. Individual Health Plan- Emergency Care
  4. Contra Costa County- Community Services Bureau Medical Statement to Request Special Meals and/or Accommodations
    - On this form if there are foods that are omitted, please list substitutes for the child.
  5. My Asthma Plan

- **Challenges**
  - Challenges that Head Start experiences are getting the forms from families filled out completely.
  - All paperwork must be completely filled out to receive funding.

Opiate P & T Meeting

- **Overview**
  - On Friday 03/23/2018, an ad hoc meeting of the CCHP Pharmacy & Therapeutics committee was held, dedicated to pain management.
  - >30 providers from the community & CCRMC attended the meeting and formulated a plan to address the opiate epidemic in Contra Costa County.
  - Topics for discussion included:
    - Background information on the opiate epidemic and CCHP
data.
  o Individual presentations & discussions on each of the 3 major goals set by CCHP.
  
- Quantifiable Goals:
  o Reduce users on both opioids and benzos.
  o Reduce the duration of initial immediate release of opioid prescriptions.
  o Reduce opioid users on >120 MED
    ▪ Reduce opioid users (>120 MED) on an escalating dose.
    ▪ Reduce the total opioid prescriptions (>120 MED) PMPM

➤ Action Items proposed at Ad-Hoc P&T
  1. To reduce co-prescribing of both opioids and benzos.
     o A Tapestry report will identify co-prescribed opioids, benzodiazepines ± soma for ALL CCHP member & ALL CCHP providers.
     o A formal letter will be sent to providers on a monthly basis, clearly stating which of their CCHP patients is on this potentially deadly combination of drugs, and that the regimen should be re-considered immediately.
       ▪ After first notification about the dangers of using these two drugs together there has been a 51% reduction.
  2. To reduce the duration of initial immediate release opioid prescriptions
     o Limit all initial immediate release opioid prescriptions for acute pain treatment to a 7 day supply.
       ▪ Exceptions: Patients with a paid claim for an opioid in the past 180 days (continuation of therapy), chronic pain patients, palliative care or hospice patients, and cancer patients.
  3. To Reduce opioid users on >120 MED
     o Placing quantity limits on all formulary opioids for each single-dose strength to a max. of 120 MME.
       ▪ Single tablet doses that exceed, or that would exceed 120mg MME in a typical dosing will be removed from the CCHP formulary completely.
     o Creation of registry (managed by CCHP clinical pharmacist staff) for all high-dose opiate patients to track treatment plan will require an explanation for all stable, high-dose opioids and a taper plan.
     o Prior authorization requests for escalating doses >120 without valid medical justification will be denied.
     o No more than 3 months of opioids are approved under any authorization request.
### IV. Discussion Items

- **Legislative Update**
  - CPN Care Matters Bulletin
    - Proposition 56 Directed Payments Expenditures for Physician Services.

- **CCHP Benefits Update**
  - Palliative Care Benefit
    - Currently have two contracted providers.
    - 4 conditions for eligibility
      - Cancer
      - Congestive Heart Failure (CHF)
      - Chronic Obstructive Pulmonary Disease (COPD)
      - Liver Disease

- **Quality**
  - Case Management
    - Case management coordinates individual services for member whose needs include assistant with coordinating health care services.
      - Refer to Case Management for transportation benefits for emergencies/appointments and transportation to pick up medications.
      - Providers and patients can call to arrange services.
      - Phone: 925-313-6887

- **Utilization Management**
  - Utilization Management Communication Services
    - Interpreter Services Resources provided in Care Matters Bulletin.

### V. Claims Q&A

- **Transition from Medic-Cal Local Codes to National Codes**
  - Important Changes to billing
    - Goes into effect June 2018
  - Training webinars will be available for billing staff or billing company.

### VI. Adjournment:
Meeting adjourned at 9:00 A.M.
Contra Costa Alcohol and Other Drugs

BEHAVIORAL HEALTH ACCESS

- Is your life or the life of someone you love affected by the use of alcohol and other drugs?
- Are you looking for alcohol and drug abuse services, resources and information?
- Need information about PC1000 & DUI?
- Interested in Medication Assisted Treatment?
- Learn how to access outpatient counseling, residential treatment, detoxification, and support groups for men, women, families and youth
- Hablamos Español

If you need alcohol and other drug abuse treatment information you can talk to a substance abuse counselor Monday through Friday during normal business hours:

Toll Free
1.800.846.1652

Outside of Contra Costa County
925.335.3310

Information Available 24/7 at: www.cchealth.org/aod

All calls are completely confidential

Other Behavioral Health Division Resources

Mental Health Access: 1.888.678.7277
Suicide Crisis Hotline: 1.800.233.2900
Homeless Hotline: 1.800.799.6599
### Ambulatory Patient Services
- Physician services
- Hospital outpatient & outpatient clinic services
- Outpatient surgery (includes anesthesiologist services.)
- Podiatry
- Chiropractic
- Allergy care
- Treatment therapies (chemotherapy, radiation therapy, etc.)
- Dialysis/hemodialysis

### Prescription Drugs
- Coverage is at least the greater of one drug in each U.S. Pharmacopeia (USP) category and class.
- Beneficiaries may receive up to a 100-day supply of many medications.

### Emergency Services
- Emergency Room services
- All inpatient and outpatient services that are necessary for the treatment of an emergency medical condition, including dental services, as certified by the attending physician or other appropriate provider.
- Ambulance services

### Rehabilitation & Habililitative Services and Devices
- Physical therapy
- Occupational therapy
- Speech therapy
- Acupuncture
- Cardiac rehabilitation
- Pulmonary rehabilitation
- Skilled Nursing Facility services (90 days)
- Medical supplies, equipment, and appliances (including implanted hearing devices)
- Durable medical equipment
- Orthotics/prostheses
- Hearing aids
- Home Health Services

### Hospitalization
- Inpatient hospital services
- Anesthesiologist services
- Surgical services (bariatric, reconstructive surgery, etc.)
- Organ & tissue transplantation

### Laboratory Services
- Outpatient laboratory and X-ray services
  - Various advanced imaging procedures are covered based on medical necessity.

### Maternity and Newborn Care
- Prenatal care
- Delivery and postpartum care
- Breastfeeding education
- Nurse midwife services
- Licensed midwife services

### Preventive & Wellness Services and Chronic Disease Management
- Preventive services and vaccines recommended by:
  - United States Preventive Services Task Force (grade A & B)
  - Advisory Committee for Immunization Practices
  - Health Resources and Services Administration’s Bright Futures
  - For women by the Institute of Medicine
- Family planning services
- Smoking cessation services
- Behavioral health treatment for children under 21

### Mental health and Substance Use Disorder (SUD) Services, including Behavioral Health Treatment
- Outpatient Mental Health services
- Outpatient Specialty Mental Health services
- Inpatient Specialty Mental Health services
- Outpatient Substance Use Disorder services
  - Residential Treatment services
  - Voluntary Inpatient Detoxification

### Pediatric Services, Including Oral and Vision Care
- Early and Periodic Screening, Diagnostic, and Treatment (EPSDT) is a Medi-Cal benefit for individuals under the age of 21 who have full-scope Medi-Cal eligibility. EPSDT provides periodic screenings to determine health care needs and, in addition to the standard Medi-Cal benefits, a beneficiary under the age of 21 may receive extended services as medically necessary.

### OTHER:
- **Dental**
  - Emergency dental services
  - Dentures
  - Dental implants and implant-retained prostheses
  - Basic preventive, diagnostic and repair services
  - EPSDT and pregnant women receive extended dental benefits.
- **Vision**
  - Routine eye exams once in 24 months
  - Eyeglasses for eligible individuals under the age of 21 and pregnant women through postpartum
- **Non-Emergency Medical Transportation Services**
  - Ambulance, litter van, or wheelchair van only when ordinary public or private conveyance is medically contra-indicated and transportation is required for obtaining needed medical care for a Medi-Cal benefit.
- **Long Term Services and Supports**
  - Skilled Nursing Facility services (91+days)
  - Personal Care Services
  - Self-Directed Personal Assistance Services
  - Community First Choice Option
  - Home and Community Based Services
Report of Health Examination - Well Child Check

To protect the health of children, California law requires a health examination within 30 days of school entry. Please have this report filled out by a health examiner and return it to the school. The school will keep and maintain it as confidential information.

CSB207- Report of Health Examination- Well Child Check

Content Revised: 6/27/17
Electronic Conversion: 03/26/2014
### Recommendations for Preventive Pediatric Health Care

#### Bright Futures/American Academy of Pediatrics

These recommendations are consistent with those of the American Academy of Pediatrics (AAP) and Bright Futures. The AAP continues to emphasize the importance of continuity of care in comprehensive health supervision and the need to avoid fragmentation of care. Refer to the specific guidance for age by visit in the Bright Futures Guidelines (Hagan JF, Shaw JS, Duncan PM, et al. Bright Futures: Guidelines for Health Supervision of Infants, Children, and Adolescents. 5th ed. Elk Grove Village, IL: American Academy of Pediatrics; 2017).

The recommendations in this statement do not indicate an exclusive course of treatment or standard of medical care. Variations, taking into account individual circumstances, may be appropriate.

Copyright 2017 by the American Academy of Pediatrics. Updated February 2017. No part of this statement may be reproduced in any form or by any means without prior written permission from the American Academy of Pediatrics except for one copy for personal use.

---

1. *If child ceases to receive care for the first time at any point on the schedule, or if any term is not accomplished at the suggested age, the schedule should be brought up-to-date at the earliest possible time.

2. A prenatal visit is recommended for parents who are at high risk for low birth weight, and for those who request a screening. The prenatal visit should include developmental assessment, parent-infant relationship, and a discussion of benefits of breastfeeding and planned method of feeding, per the "Recommended" visit strategy for breastfeeding and "Breastfeeding and the Use of Human Milk" (https://pediatrics.aappublications.org/content/129/3/e927.full). Newborns discharged less than 48 hours after delivery should be discharged from the hospital to include evaluation for hearing and breastfeeding. Breastfeeding should be initiated within the first hour of birth, per "Hospital Stay for Healthy Newborns" (https://pediatrics.aappublications.org/content/129/5/e485.full).

3. Newborns should have an evaluation at birth, and breastfeeding should be encouraged and monitored by the nurse and support should be available.

4. Newborns should have an evaluation within 3-6 days of birth and within 48 to 72 hours after discharge from the hospital to include evaluation for hearing and breastfeeding. Breastfeeding should be initiated within the first hour of birth, per "Hospital Stay for Healthy Newborns" (https://pediatrics.aappublications.org/content/129/5/e485.full).

5. Screen for developmental abnormalities, vision, and hearing. Use screening forms and follow-up as appropriate. Newborns should be screened per "2017 Evidence-Based Practice Statement: Principles and Guidelines for Early Hearing Detection and Intervention Programs" (http://dx.doi.org/10.1542/peds.2016-3756).

6. Blood pressure measurement in infants and children with specific risk conditions should be performed at visits before age 3 years.

7. At least one visit at ages 3 and 6 years, as well as in consecutive 3-year-olds. Instrument-based screening may be used as soon as age 6 months. In the well-child visit at 36 months of age, see "Vitals System Assessment in Infants, Children, and Youth: A Guide for Pediatricians" (https://pediatrics.aappublications.org/content/107/3/e522.full) and "Growth and Maturation of the Infant and Child" (https://pediatrics.aappublications.org/content/107/2/456.full).

8. In the office, a visual and aural screening is recommended for the beginning of the second year. At age 2, see "Assessment of Vision and Hearing in Infants and Young Children: A Guide for Pediatricians" (https://pediatrics.aappublications.org/content/129/1/13.4.full).

10. Carrying out this visit, age-appropriate physical examination is essential, with infant individually scheduled to avoid anxiety. In "The Physical Examination of the Pediatric Patient" (https://pediatrics.aappublications.org/content/127/2/361.full).

11. These recommendations may be modified, depending on entry point into schedule and individual need.
### My Asthma Plan

**Controller Medicines**

<table>
<thead>
<tr>
<th>How Much to Take</th>
<th>How Often</th>
<th>Other Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Quick-Relief Medicines**

- Albuterol (ProAir, Ventolin, Proventil)
- Levalbuterol (Xopenex)

<table>
<thead>
<tr>
<th>How Much to Take</th>
<th>How Often</th>
<th>Other Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Special instructions when I am doing well,**

- No cough, wheeze, chest tightness, or shortness of breath during the day or night.
- Can do usual activities.

**PEAK FLOW** (for ages 5 and up): is ______ or more. (80% or more of personal best)

**Personal Best Peak Flow** (for ages 5 and up): ______

**Getting worse.**

- Cough, wheeze, chest tightness, shortness of breath, or waking at night due to asthma symptoms, or can do some, but not all, usual activities.

**PEAK FLOW** (for ages 5 and up): _____ to ______ (50 to 79% of personal best)

**Medical Alert**

- Very short of breath, or quick-relief medicines have not helped, or cannot do usual activities, or symptoms are same or get worse after 24 hours in Yellow Zone.

**PEAK FLOW** (for ages 5 and up): less than _______ (50% of personal best)

**Danger! Get help immediately!** Call 911 if trouble walking or talking due to shortness of breath or if lips or fingernails are gray or blue. For child, call 911 if skin is sucked in around neck and ribs during breaths or child doesn’t respond normally.

**Health Care Provider:** My signature provides authorization for the above written orders. I understand that all procedures will be implemented in accordance with state laws and regulations. Student may self carry asthma medications: ❑ Yes ❑ No self administer asthma medications: ❑ Yes ❑ No (This authorization is for a maximum of one year from signature date.)

Healthcare Provider Signature: ___________________________ Date: ___________________________
At initial presentation, determine the level of asthma severity

- Level of severity is determined by both impairment and risk and is assigned to the most severe category in which any feature occurs.

At subsequent visits, assess control to adjust therapy

- Level of control is determined by both impairment and risk and is assigned to the most severe category in which any feature occurs.
- Address adherence to medication, inhaler technique, and environmental control measures.
- Sample patient self-assessment tools for asthma control can be found at http://www.asthmacontrol.com/index.html
  http://www.asthmacontrolcheck.com

Stepwise approach for managing asthma:

- Therapy is increased (stepped up) if necessary and decreased (stepped down) when possible as determined by the level of asthma severity or asthma control.

Asthma severity and asthma control include the domains of current impairment and future risk.

Impairment: frequency and intensity of symptoms and functional limitations the patient is currently experiencing or has recently experienced.

Risk: the likelihood of either asthma exacerbations, progressive decline in lung function (or, for children, reduced lung growth), or risk of adverse effects from medication.

ASThma MANAGEMENT RECOMMENDATIONS:

- Ensure that patient/family receive education about asthma and how to use spacers and other medication delivery devices.
- Assess asthma control at every visit by self-administered standardized test or verbal history.
- Perform spirometry at baseline and at least every 1 to 2 years for patients ≥ 5 years of age.
- Update or review the Asthma Action Plan every 6 to 12 months.
- Perform skin or blood allergy tests for all patients with persistent asthma.
- Encourage patient/family to continue follow-up with their clinician every 1 to 6 months even if asthma is well controlled.
- Refer patient to a specialist if:
  - there are difficulties achieving or maintaining control
  - step 4 care or higher is required (step 3 care or higher for children 0-4 years of age) OR
  - immunotherapy or omalizumab is considered OR
  - additional testing is indicated OR
  - if the patient required 2 bursts of oral systemic corticosteroids in the past year or a hospitalization.

HOW TO USE THE ASTHMA ACTION PLAN:

Top copy (for patient):
- Enter specific medication information and review the instructions with the patient and/or family.
- Educate patient and/or family about factors that make asthma worse and the remediation steps on the back of this form.
- Complete and sign the bottom of the form and give this copy of the form to the patient.

Middle copy (for school, childcare, work, etc):
- Educate the parent/guardian on the need for their signature on the back of the form in order to authorize student self-carry and self-administration of asthma medications at school and also to authorize sharing student health information with school staff.
- Provide this copy of the form to the school/childcare center/work/caretaker or other involved third party. (This copy may also be faxed to the school, etc.)

Bottom copy (for chart):
- File this copy in the patient’s medical chart.

FOR MORE INFORMATION:

To access the August 2007 full version of the NHLBI Guidelines for the Diagnosis and Treatment of Asthma (EPR-3) or the October 2007 Summary Report, visit http://www.nhlbi.nih.gov/guidelines/asthma/index.htm.
Controlling Things That Make Asthma Worse

**SMOKE**
- Do not smoke. Attend classes to help stop smoking.
- Do not allow smoking in the home or car. Remaining smoke smell can trigger asthma.
- Stay away from people who are smoking.
- If you smoke, smoke outside.

**DUST**
- Vacuum weekly with a vacuum with a high efficiency filter or a central vacuum. Try to make sure people with asthma are not home during vacuuming.
- Remove carpet if possible. Wet carpet before removing and then dry floor completely.
- Damp mop floors weekly.
- Wash bedding and stuffed toys in hot water every 1-2 weeks. Freeze stuffed toys that aren’t washable for 24 hours.
- Cover mattresses and pillows in dust-mite proof zippered covers.
- Reduce clutter and remove stuffed animals, especially around the bed.
- Replace heating system filters regularly.

**PESTS**
- Do not leave food or garbage out. Store food in airtight containers.
- Try using traps and poison baits, such as boric acid for cockroaches. Instead of sprays/bombs, use baits placed away from children, such as behind refrigerator.
- Vacuum up cockroach bodies and fill holes in with caulking or copper wool.
- Fix leaky plumbing, roof, and other sources of water.

**MOLD**
- Use exhaust fans or open windows for cross ventilation when showering or cooking.
- Clean mold off hard surfaces with detergent in hot water and scrub with stiff brush or cleaning pad, then rinse clean with water. Absorbent materials with mold may need to be replaced.
- Make sure people with asthma are not in the room when cleaning.
- Fix leaky plumbing or other sources of water or moisture.

**ANIMALS**
- Consider not having pets. Avoid pets with fur or feathers.
- Keep pets out of the bedroom of the person with asthma.
- Wash your hands and the hands of the person with asthma after petting animals.

**ODORS/SPRAYS**
- Avoid using strongly scented products, such as home deodorizers and incense, and perfumed laundry products and personal care products.
- Do not use oven/stove for heating.
- When cleaning, keep person with asthma away and don’t use strong smelling cleaning products.
- Avoid aerosol products.
- Avoid strong or extra strength cleaning products.
- Avoid ammonia, bleach, and disinfectants.

**POLLEN AND OUTDOOR MOLDS**
- Try to stay indoors when pollen and mold counts are high.
- Keep windows closed during pollen season.
- Avoid using fans; use air conditioners.

**Colds/Flu**
- Keep your body healthy with enough exercise and sleep.
- Avoid close contact with people who have colds.
- Wash your hands frequently and avoid touching your hands to your face.
- Get an annual flu shot.

**Weather and Air Pollution**
- If cold air is a problem, try breathing through your nose rather than your mouth and covering up with a scarf.
- Check for Spare the Air days and nights and avoid strenuous exercise at those times.
- On very bad pollution days, stay indoors with windows closed.

**Exercise**
- Warm up before exercising.
- Plan alternate indoor activities on high pollen or pollution days.
- If directed by physician, take medication before exercise. (See Green Zone of Asthma Action Plan.)

*For this purpose, a state licensed healthcare professional in California is a licensed physician, a physician assistant, or a nurse practitioner.

18. To be completed by Parent/Guardian: I give my permission to Community Services Bureau to release and exchange the above information, and post it in the classroom to ensure my child’s health and safety.

Parent/Guardian Signature: ___________________________  Date: __________________

The information on this form should be updated to reflect the current medical and/or nutritional needs of the participant.

In accordance with Federal civil rights law and U.S. Department of Agriculture (USDA) civil rights regulations and policies, the USDA, its agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, sex, disability, age, or reprisal or retaliation for prior civil rights activity in any program or activity conducted or funded by USDA.

Persons with disabilities who require alternative means of communication for program information (e.g. Braille, large print, audiotape, American Sign Language, etc.), should contact the Agency (State or local) where they applied for benefits. Individuals who are deaf, hard of hearing or have speech disabilities may contact USDA through the Federal Relay Service at (800) 877-8339. Additionally, program information may be made available in languages other than English.

To file a program complaint of discrimination, complete the USDA Program Discrimination Complaint Form, (AD-3027) found online at: http://www.ascr.usda.gov/complaint_filing_cust.html, and at any USDA office, or write a letter addressed to USDA and provide in the letter all of the information requested in the form. To request a copy of the complaint form, call (866) 632-9992. Submit your completed form or letter to USDA by mail: U.S. Department of Agriculture Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue, SW Washington, D.C. 20250-9410; fax: (202) 690-7442; or email: program.intake@usda.gov. This institution is an equal opportunity provider.
INSTRUCTIONS

1. **School or Agency:** Print the name of the school or agency that is providing the form to the parent.

2. **Site:** Print the name of the site where meals will be served.

3. **Site Phone Number:** Print the phone number of site where meal will be served.

4. **Name of Child or Participant:** Print the name of the child or participant to whom the information pertains.

5. **CLOUDS ID #:** Print child’s CLOUDS ID number.

6. **Age of Child or Participant:** Print the age of the child or participant. For infants, please use date of birth.

7. **Name of Parent or Guardian:** Print the name of the person requesting the child or participant’s medical statement.

8. **Phone Number:** Print the phone number of parent or guardian.

9. **Description of Child or Participant’s Physical or Mental Impairment Affected:** Describe how the physical or mental impairment restricts the child or participant’s diet.

10. **Explanation of Diet Prescription and/or Accommodation to Ensure Proper Implementation:** Describe a specific diet or accommodation that has been prescribed by the state healthcare professional.

11. **Indicate Texture:** If the child or participant does not need any modification, check “Regular”.

12. **Foods to be Omitted:** List specific foods that must be omitted (e.g., exclude fluid milk).

   **Suggested Substitutions:** List specific foods to include in the diet (e.g., calcium-fortified juice).

13. **Adaptive Equipment to be Used:** Describe specific equipment required to assist the child or participant with dining (e.g., sippy cup, large handled spoon, wheel-chair accessible furniture, etc.).

14. **Signature of State Licensed Healthcare Professional:** Signature of state licensed healthcare professional requesting the special meal or accommodation.

15. **Printed Name:** Print name of state licensed healthcare professional.

16. **Phone Number:** Phone number of state licensed healthcare professional.

17. **Date:** Date state licensed healthcare professional signed form.

18. **Parent/Guardian Signature & Date:** Signature of Parent/Guardian and date parent/guardian signed form.

Citations are from Section 504 of the Rehabilitation Act of 1973, Americans with Disabilities Act (ADA) of 1990, and ADA Amendment Act of 2008:

A person with a disability is defined as any person who has a physical or mental impairment which substantially limits one or more major life activities, has a record of such impairment, or is regarded as having such an impairment.

Physical or mental impairment means (a) any physiological disorder or condition, cosmetic disfigurement, or anatomical loss affecting one or more of the following body systems: neurological; musculoskeletal; special sense organs; respiratory; speech; organs; cardiovascular; reproductive, digestive, genito-urinary; hemic and lymphatic; skin; and endocrine; or (b) any mental or psychological disorder, such as mental retardation, organic brain syndrome, emotional or mental illness, and specific learning disabilities.

Major life activities include, but are not limited to, caring for oneself, performing manual tasks, seeing, hearing, eating, sleeping, walking, standing, lifting, bending, speaking, breathing, learning, reading, concentrating, thinking, communicating, and working.

Major bodily functions have been added to major life activities and include the functions of the immune system; normal cell growth; and digestive, bowel, bladder, neurological, brain, respiratory, circulatory, endocrine, and reproductive functions.

“Has a record of such an impairment” means a person has, or has been classified (or misclassified) as having, a history of mental or physical impairment that substantially limits one or more major life activities.
The Origins of the Epidemic

BACKGROUND INFORMATION

AIM STATEMENT

3: WME Initiatives and Reporting Metrics
2: Resilience and Preactive Measures for New
   Preadolescents, Pre-Adolescents, and Adolescents
1: Initial에 CHP

Initial: Information on opioid use, opioid prescription, and CHP data.
Topics of major discussion included:
- Opioid use among high-risk populations
- Opioid use among low-risk populations
- Opioid use among moderate-risk populations

The initial initiatives were held, dedicated to pain management.
On Friday, 3/23/2018, an ad hoc meeting of the CHP's Pain Management
Committee (designated to pain management)

AD HOC MEETING OF THE CHP PHARMACY & THERAPEUTICS

**California County Opioid Use Disorder and Treatment Needs in California**

**Contra Costa County**

- Emphasizes the importance of access to opioid use disorder treatment.
- Highlights the need for better access to opioid use disorder treatment.
- Mentions the increase in deaths due to prescription opioids from 2013 to 2014.

---

**Opioid-Related Deaths in Contra Costa County**

- Represents the geographical distribution of opioid-related deaths from 2011 to 2015.
- Indicates an increase in deaths from 2011 to 2012.
- Shows a decrease in deaths from 2013 to 2014.

---

**Note:**

- Data from the California Department of Public Health.
- Includes hospital visits for opioid overdoses.

---

**% Change**

- 2013 to 2014: +5.8%
- 2014 to 2015: +13.8%
ot opioid overdoses in the state.

Partnership Health Plan comprised of 14
Northern California counties and 550,000

Crisis Opioid

Crisis Opioid
Proposed criteria based on:

Chronic Pain — United States 2016

CPC Guideline for Prescribing Opioids for Chronic Pain

经历成功健康伙伴关系作为合作伙伴的・Medical Literature

BESM, etc.

Proposed goals:

- Reduce the total opioid prescriptions (≤20 MED) per patient.
- Reduce opioid users on ≥120 MED.
- Reduce the duration of initial immediate-release opioid prescriptions.
- Reduce use of both opioids and benzodiazepines.

Quantifiable goals:

- QoL improvement
- Goals: DART (≤3), GM (≤10)
- DART = Drug and Alcohol Treatment
- GM = Group Management
- QoL = Quality of Life

Non-pharmacological modalities:

- Cognitive Behavioral Therapy
- Chiropractic
- Physical Therapy
- Aquatic therapy

Non-opioid alternative therapies:

- Currently available on Formulary: No Pain!

Officially colonial new criteria

TBD: Late 2018 to Jan 2019

Summer 2018

March 2018 P&T meeting
 Benzodiazepines should not be used chronically (\textsuperscript{1}e \textsuperscript{1} month) for the following reasons:

- Benzodiazepines lose their efficacy when used chronically and are addictive.
- May worsen anxiety, insomnia with prolonged use.
- Accidental falls and injuries, especially in elderly cause increased hospital admissions.
- There are safer alternatives for anxiety and insomnia that can be used long term.

Goal #1: Reduce users on both opioids and benzodiazepines

**FDAA Drug Safety Communication: FDA Warns Benzodiazepines: Requires its strongest warning about serious risks and death when combining with opioid pain or cough medicines.**

Opioid overdose is a leading cause of accidental death. The National Institute on Drug Abuse, 8,000 deaths on drug abuse. 8,000 deaths as a result of overdose.

Benzodiazepine involvement in opioid overdose.
Goal #1: Reduce users on both opioids and benzodiazepines

- CHP will implement a model similar to BCBSM:
  - Implement outcomes
  - A letter will providers
  - musicians
  - A response from clients on prescribed opioids, benzodiazepines

Blue Cross Blue Shield of Michigan conducted DUR and notified providers

Goal #1: Reduce users on both opioids and benzodiazepines
Goal #2: Reduce the duration of initial opioid prescriptions

Published guidelines and literature support limitations on initial opioid prescription initiation.

Published guidelines and literature support limitations on initially prescribed opioids.

Newly dependent upon or addicted to opioids

Aim to significantly reduce the number of people needed.

Sufficient: more than seven days will rarely be required opioids. Three days or less will often be insufficient. The expected duration of pain severe enough to require opioids should prescribers no greater quantity than needed for acute pain, clinicians should prescribe the lowest effective dose of immediate release opioids and according to guidelines state: "When opioids are used for..."
**Goal #3:** Reduce opioid users on >120 MED

- **Goal:** Reduce opioid users on >120 MED.

- **Proposal:**
  - Reduce opioid users on >120 MED.
  - Among 8.4% patients on >120 MED, overdose resulting in death over.
  - Annualized number of deaths for those patients.
  - Risk assessment found that for those patients.

- **Outcome:**
  - 8.4% of patients on >120 MED.
  - 1.7% of those patients had an overdose resulting in death over.

---

**Goal #2:** Reduce the duration of initial opioid prescriptions

- **Proposed Change:**
  - CHP will be implementing a formulary change that will limit all initial immediate release opioid prescriptions to a seven (7) day supply.
  - Exceptions: Patients with a prior claim for an opioid in the past 180 days.

- **Supplemental Guidance:**
  - For all patients, high-dose opioids and a 7-day supply.
  - A summary chart provided on all formulary extended release opioids for each single dose.

---

**Goal #1:** Reduce high-dose opioids and a 7-day supply.

- **Proposed Change:**
  - CHP will be implementing a formulary change that will limit all initial immediate release opioids.

- **Supplemental Guidance:**
  - For all patients, high-dose opioids and a 7-day supply.
  - A summary chart provided on all formulary extended release opioids for each single dose.

---

**Health Plan, Express Scripts**

- Other examples of programs in place: FCHP, Anthem, Partnership

- Initial opioid prescription limits
  - Initial opioid prescription limits
  - And several chain pharmacies have instituted voluntary
  - Over the past year, at least 8 states, many health plans.
Plan to taper the opioid of concern to non-opioid-based pain management.
- Opioid use monitored by pain specialists.
- Diagnosis of substance use disorder being supervised by MD.
- Referral to palliative care or cancer therapy.

Appropriate medical illustrations for continued therapy:

Palliative care

Goal 3: Reduce opioid users on >120 MED

CDC Recommendation: "Clinicians should use caution when prescribing opioids to any dose above 120 MEDs" (recommendation decision to decrease dose to ≤ 90 MEDs/day). (Recommendation)
\textbf{GOAL #3}

\textbf{Goal 3: Implement the following:}

- CHP will improve the following:
  - Extended-release oxycodone 40mg
  - Extended-release oxycodone 60mg
  - Hydrocodone 10mg

**Fundamentals:**

- When the dose exceeds 70 mgMME (mg morphine), the opioid may be removed from the CHP network.

**Reasons:**

- To avoid high-dose opioids and better support patients in their treatment plans.

**Key Points:**

- CHP does not exceed 70 mgMMEs.
- Single label dose does exceed or that would exceed 70 mgMME.
- Reading quantity limits on all CHP products.

**Example:**

- CHP uses a chronic pain registry to:
  - Establish a registry of all CHP members on chronic high dose opioids.
  - This report would be used to identify patients on high dose opioids.

**Contingency Plan:**

- If any of the above goals are not met, the following actions will be taken: 
  - Denial of new enrollments if no program is in place to monitor use.
  - Referral to additional resources for high-dose opioids.
  - Additional educational sessions for opioid management.

**Exclusion:**

- Enrollees on high-dose opioids may be excluded from the program.

**Alerts:**

- Alerts for ongoing dosing at >120 MED will require a plan to decrease dose.

**Goal 3:**

- Reduce opioid use on >120 MED, leveraging dose escalation to MED >120.

- Denial of new enrollments if no program is in place to monitor use.

**Goal 4:**

- Establish a registry of all CHP members on chronic high dose opioids.

**Goal 5:**

- Review program outcomes to improve compliance and reduce risk of adverse effects.

SUMMARY:
Zika virus infection during pregnancy continues to be of great concern due to the potential for Zika associated birth defects. But because of the declining incidence of new Zika virus infections in California, the California Department of Public Health (CDPH) has issued new guidelines for the management of pregnant women with possible Zika virus exposure. The declining rate of Zika virus infections, coupled with the inherent limitations of Zika virus testing, has lowered the pre-test probability of infection, further complicating test interpretation. Please see CDPH’s “Updated Guidance for Health Care Providers Caring for Pregnant Women with Possible Zika Virus Exposure” for details and rationale. https://www.cdph.ca.gov/Programs/CID/DCDC/Pages/ZikaInformationforHealthProfessionals.aspx

UPDATE:
Zika virus testing by detection of viral RNA by PCR (nucleic acid testing, NAT) or serology (IgM antibody testing) is now widely available in commercial clinical laboratories throughout California. Please submit your specimens to commercial laboratories for processing using your regular clinical testing protocol. When needed, local public health laboratories and CDPH will conduct confirmatory Zika virus testing (plaque reduction neutralization testing, PRNT), which is not a commercially available test.

Actions Requested of Healthcare Professionals:
1. Advise pregnant patients not to travel to areas with Zika virus transmission. For non-pregnant patients and pregnant patients who cannot avoid travel, educate on how to avoid mosquito bites and potential sexual transmission. Refer travelers to CDC Travel Advisories for current information about Zika virus and prevention: http://wwwnc.cdc.gov/travel/notifications
2. Assess all pregnant women for possible Zika virus exposure at each prenatal care visit. The following topics should be reviewed: 1) recent travel or residence in an area with active Zika transmission, and 2) unprotected sex (vaginal, anal or oral sex, or sharing of sex toys without using a barrier method) with a partner who has traveled to or lived in an area with known Zika transmission.
3. Suspect Zika (also consider Dengue and Chikungunya) in travelers with acute onset of fever, rash, arthralgia, myalgia or conjunctivitis within 2 weeks after: 1) return from an area with local Zika transmission or 2) unprotected sex with a partner who has traveled to or lives in an area with active Zika transmission.
4. Report non-negative (positive or indeterminate) cases of Zika virus infection and possible congenital exposure to Contra Costa Public Health by faxing the ‘Zika Case History Form’ (http://cchealth.org/cd/pdf/Zika-Case-History-Form.pdf) to 925-313-6465.
5. Test patients by sending appropriate specimens to your contracted clinical commercial laboratory. See below for details about testing and specimen collection.
WHO TO TEST:

TESTING BY EXPOSURE GROUPS

- Pregnant women with symptoms of Zika virus disease (acute onset of fever, rash, arthralgia, or conjunctivitis).
  - Testing should be done as soon as possible.
- Asymptomatic pregnant women with ongoing possible Zika virus exposure
  - Zika IgM antibody and PCR testing may be considered after pre-test counseling and individualized risk assessment for those with an appropriate exposure history (e.g., exposure limited to current pregnancy), but is not routinely recommended.
- Asymptomatic pregnant women with recent but without ongoing exposure
  - May not be routinely tested but instead should be assessed carefully for factors that increase the likelihood of Zika infection.
  - A patient’s risk tolerance and decision-making regarding pregnancy may be sufficient justification to test for Zika virus infection.
- Pregnant women who have recent possible Zika virus exposure and who have a fetus with prenatal ultrasound findings consistent with congenital Zika virus syndrome
  - Should receive Zika virus testing to assist in establishing the etiology of the birth defects.
- Infants/Neonates with:
  - Exposure occurring at any time during mother’s pregnancy,
  - Born to a mother with a positive or inconclusive laboratory result,
  - Possible congenital Zika virus infection (microcephaly at birth, intracranial calcifications detected prenatally or at birth, or other brain or eye abnormalities consistent with Zika virus infection or symptoms consistent with acute Zika virus infection within 2 weeks of birth).
- Symptomatic non-pregnant travelers or sexual partners of travelers with possible Zika virus exposure
  - Not high priority unless attempting pregnancy or sexual partner is pregnant or trying to become pregnant.

EXPOSURE IS DEFINED AS:

- Recent travel to an area with risk of Zika virus*
- Resident of an area with risk of Zika virus*
- Recent unprotected sexual contact with
  - a male who has traveled in the past 6 months to an area with risk of Zika virus
  - a female who has traveled in the past 8 weeks to an area with risk of Zika virus

### How to Test for Zika Virus in Adults

<table>
<thead>
<tr>
<th>Pregnancy Status¹</th>
<th>Zika Virus RNA [i.e. PCR, NAT, or NAA] (Serum &amp; Urine)</th>
<th>Zika Virus Antibody, IgM (Serum)</th>
</tr>
</thead>
<tbody>

[https://www.cdc.gov/mmwr/volumes/66/wr/mm6629e1.htm?s_cid=mm6629e1_w](https://www.cdc.gov/mmwr/volumes/66/wr/mm6629e1.htm?s_cid=mm6629e1_w)

² Update: Interim Guidance for the Diagnosis, Evaluation, and Management of Infants with Possible Congenital Zika Virus Infection — United States, October 2017 (MMWR, October 2017)  
[https://www.cdc.gov/mmwr/volumes/66/wr/mm6641a1.htm](https://www.cdc.gov/mmwr/volumes/66/wr/mm6641a1.htm)
TREATMENT

- There is no specific treatment for Zika infection; clinical guidance is to provide supportive care including rest, fluids, and use of analgesics and antipyretics (after Dengue has been ruled out).

PREVENTION

- Pregnant women should not travel to any area where Zika virus is spreading.
- Preventing mosquito bites is the main control measure to avoid becoming infected.
- Persons with Zika virus exposure can pass the infection to sex partners. A correctly used barrier method (condoms or dental dams) can reduce the risk of Zika transmission.
- Counsel patients about pregnancy planning and the timing of pregnancy after possible exposure to Zika virus.
  - Pregnant couples in which one or both partners have traveled to or live an area with Zika should use a condom (or other barriers to prevent infection) every time they have sex, should not share sex toys and/or should not have sex during the pregnancy.
  - Couples interested in conceiving should wait to get pregnant.
    - Women, regardless of symptom status, should wait at least 8 weeks from symptom onset (if symptomatic) or last possible exposure (if asymptomatic) to attempt conception.
    - Men, regardless of symptom status, wait at least 6 months from symptom onset (if symptomatic) or last possible exposure (if asymptomatic) before attempting conception with their partner. Zika virus can be detected in semen for a longer period of time than in blood.

- Interim Guidance for Interpretation of Zika Virus Antibody Test Results (MMWR, May 2016) (http://www.cdc.gov/mmwr/volumes/65/wr/mm6521e1.htm)
This document provides an update on the Department of Health Care Services (DHCS) Medi-Cal palliative care policy as authorized by SB 1004 (Hernandez, Chapter 574, Statutes of 2014). This November 2017 version reflects minor updates, and is consistent with DHCS All Plan Letter 17-015, published October 19, 2017.

The DHCS Medi-Cal palliative care policy is applicable to both managed care and fee-for-service delivery systems. Due to the specific focus of SB 1004, this document is oriented toward Medi-Cal only beneficiaries enrolled in Medi-Cal managed care plans (MCPs). Further guidance will be provided for Medi-Cal only fee-for-service beneficiaries not enrolled in MCPs.

Section 1: SB 1004 Medi-Cal Palliative Care, and Overall Context

The Centers for Medicare and Medicaid Services (CMS) defines palliative care as: “patient and family-centered care that optimizes quality of life by anticipating, preventing, and treating suffering. Palliative care throughout the continuum of illness involves addressing physical, intellectual, emotional, social, and spiritual needs and to facilitate patient autonomy, access to information, and choice.” Many physicians and practitioners note that palliative care is an overall approach to the practice of medicine that is broader than end-of-life care, and is for “any age and any stage” of illness.

For purposes of SB 1004 guidance, DHCS proposes a Medi-Cal palliative care policy that is guided by the CMS definition of palliative care and the substantial body of research on palliative care programs, and with specific definitions of eligible conditions, services, and providers. The purpose of defining Medi-Cal palliative care more narrowly for a specific set of conditions is to meet the specific requirements of SB 1004, and to recognize that long-term success in implementing a new program to improve end of life care for Medi-Cal beneficiaries is more likely to be achieved through an incremental approach.

At the same time, a number of Medi-Cal managed care health plans (MCPs), hospitals and health systems, and other providers are already incorporating broader palliative care principles and strategies into their models of care. DHCS encourages those strategies to improve patient satisfaction and outcomes for Medi-Cal beneficiaries at all stages of life and illness, and to help meet the goals of Let’s Get Healthy California and the DHCS Quality Strategy.

Early Palliative Care

At initial diagnosis of serious illness, early palliative care may accompany disease modifying care (curative care or restorative intent). Early palliative care is often advance care planning and can include palliative care consultation or pain and symptom management as needed, but may not reflect the full array of services listed below for SB 1004 palliative care. Research indicates patients and families have higher satisfaction and alignment of care with treatment wishes when advance care planning conversations occur earlier in the disease process. For example, a patient with a recent diagnosis of Stage II cancer, who is proceeding with initial chemotherapy, does not have related emergency department visits or inpatient stays, and whose condition is stable, should be offered early palliative care, but may not be eligible for SB 1004 palliative care.

1 APL 17-015 can be found at:
Hospice Care
Note that hospice care also serves seriously ill patients, but is distinct from SB 1004 Medi-Cal palliative care. Hospice care is a Medi-Cal benefit that is available to both managed care and fee-for-service beneficiaries who have a medical prognosis of six months or less to live, and is provided in lieu of curative treatment for the terminal condition. Palliative care may be provided concurrently with curative care while hospice care may not, and palliative care is not limited to beneficiaries with a medical prognosis for life expectancy of six months or less. Further information about hospice care in Medi-Cal can be found in the DHCS All-Plan Letter 13-014 for managed care, and in Title 22 of the California Code of Regulations, Section 51349.

Figure 1

Care Model for SB 1004 Medi-Cal Palliative Care

Advance Care Planning can occur at any time, including the POLST* form for those with serious illness.

* Patients with serious illness can complete a Physicians Authorization for Life-Sustaining Treatment (POLST) form with their provider. The POLST is a statewide standard form for seriously ill patients to indicate to medical personnel whether the patient desires or declines resuscitation, intubation, feeding tubes and other interventions.
Figure 1 above provides an overview of the care model for SB 1004 Medi-Cal palliative care. The design is adapted from the National Consensus Project for Quality Palliative Care.

At initial diagnosis of serious illness, early palliative care may accompany disease modifying care (curative care or restorative intent). Early palliative care is often advance care planning and/or palliative care consultation, and can include pain and symptom management as needed. The wavy line indicates that the proportion of palliative care varies based on individual patient choices and needs. As the patient’s illness progresses, those with serious illness who meet specific clinical eligibility criteria can enroll in SB 1004 palliative care programs and also continue to access disease modifying care. As the patient’s illness progresses further, those who meet hospice eligibility criteria can disenroll from SB 1004 palliative care, and enroll in hospice to receive additional comfort care and forego further disease modifying care. Note that specific services for individual patients are based on medical necessity, and this figure is for general descriptive purposes only. Also, additional options are available for children.

Case Example: Provision of Palliative Care and Hospice through the Course of Illness

Primary/Early Palliative Care
Patient A is a 55 year-old woman diagnosed with stage IIA breast cancer, who is being evaluated in oncology clinic for initial treatment with chemotherapy and hormone therapy. She has been working for several years, is a single mother of three adult children, including one about to enter college. She reports feeling stress and anxiety in juggling work, treatment, and support for her child entering college.

- Considerations for early palliative care:
  - Psychosocial and spiritual support in coping with the diagnosis
  - Practical assistance with paperwork for Family Medical Leave Act, disability, etc.
  - Education and support for family members
  - Symptom management during treatment
  - Introduction of advance care planning and identification of surrogate decision-maker

SB 1004 Palliative Care
Patient A underwent mastectomy, four cycles of chemotherapy and hormone therapy, and seemed to have no evidence of disease progression. She returned to work and had resumed her normal activities, with some modifications, for 18 months; however, she has recently become more fatigued and has had to take days off of work to rest. She returned to see her primary care doctor for progressive back pain, which she attributed to strain while moving furniture; unfortunately, x-rays of her spine showed a lesion suspicious for a metastasis, as well as lung nodules. Patient was diagnosed with advanced cancer and referred back to her oncologist for follow-up, who presents options of palliative radiation and chemotherapy to potentially extend and improve the quality of her life.

---

2 Example developed by Anne Kinderman, MD, Director of the Supportive & Palliative Care Service Program at Zuckerberg San Francisco General and Associate Professor of Medicine at the University of California San Francisco.
Considerations for palliative care
- Psychosocial and spiritual support in coping with disease progression
- Practical assistance with applying for disability and counseling regarding financial planning, insurance issues
- Education and support for family members
- Discussion of benefits/burdens of treatment options and goals of care
- Symptom management during treatment
- Focused advance care planning and designation of durable power of attorney for healthcare, if not already done

Hospice Care
Patient A chose to undergo both palliative radiation and chemotherapy for her stage IV breast cancer, and experienced some relief from her back pain. Unfortunately, she had difficulty tolerating the chemotherapy regimen, due to fatigue and nausea. Nevertheless, she completed an additional four cycles of chemotherapy in the hopes that this would provide her with more time with her family. Unfortunately, on follow-up CT scans, the metastatic disease in her lungs had continued to progress, in spite of treatment. Patient A’s palliative care and oncology providers discuss this bad news with her, and inform her of options to try third line chemotherapy, or enroll in hospice. Based on the difficulty she had tolerating the second line chemotherapy, she decided to enroll in hospice care at home.

Considerations for hospice:
- Psychosocial and spiritual support in coping with end of life
- Practical assistance with caregiving services, health aides, meal services, etc.
- Counseling regarding financial planning, insurance issues
- Education and support for family members
- Transition to inpatient hospice or skilled nursing facility if needed
- Symptom management through disease progression and end of life
- Focused advance care planning and designation of durable power of attorney for healthcare, if not already done
- Completion of POLST form

Palliative Care Options for Children
Additional options for children include the Section 1915(c) Home and Community Based Services waiver known as Partners for Children (PFC), to provide hospice-like services in addition to Medi-Cal State Plan services for seriously-ill children. Also, Section 2302 of the Patient Protection and Affordable Care Act (ACA) provides authority for hospice care concurrently with curative care for beneficiaries under age 21. Information regarding the concurrent care policy for children is available in DHCS All Plan Letter 13-014, California Children’s Services Numbered Letter 06-1011, and Managed Care Policy Letter 11-004. Concurrent care for children is a statewide benefit, and PFC waiver enrollment is available in several counties in the state.

DHCS policy for SB 1004 is without regard to age, so beneficiaries under age 21 may be eligible for SB 1004 palliative care services if they meet the general and disease-specific eligibility criteria. However, both concurrent care under Section 2302 of the ACA and the PFC waiver provide additional services and broader eligibility criteria for children than SB 1004.
Section 2: Eligible Conditions

Eligible conditions for SB 1004 Medi-Cal palliative care include Cancer, Congestive Heart Failure (CHF), Chronic Obstructive Pulmonary Disease (COPD), or Liver Disease. Based on the significant body of national research on palliative care, and the results of existing palliative care programs, these four conditions are most promising for improved patient satisfaction and health outcomes, and permit cost-effective implementation.

Based on feedback from a panel of palliative care experts, beneficiary eligibility for SB 1004 Medi-Cal palliative care should be determined through a clinical review consisting of general eligibility criteria and disease-specific criteria. Beneficiaries would need to meet all items in the general eligibility criteria in subsection A and at least one of the four disease-specific criteria in subsection B below.

A. General Eligibility Criteria:

1. The beneficiary is likely to or has started to use the hospital or emergency department as a means to manage his/her advanced disease. This refers to unanticipated decompensation and does not include elective procedures.

2. The beneficiary has an advanced illness, as defined in section B below, with appropriate documentation of continued decline in health status, and is not eligible for or declines hospice enrollment.

3. The beneficiary’s death within a year would not be unexpected based on clinical status.

4. The beneficiary has either received appropriate patient-desired medical therapy or is a beneficiary for whom patient-desired medical therapy is no longer effective. Patient is not in reversible acute decompensation.

5. The beneficiary and, if applicable, the family/patient-designated support person, agrees to:
   a. Attempt, as medically/clinically appropriate, in-home, residential-based, or...

---

3 The SB 1004 palliative care criteria are based on the Sharp HealthCare Transitions Guidelines for Advanced Illness Management, developed by Daniel R. Hoefer, MD, Chief Medical Officer of Outpatient Palliative Care and Hospice for Sharp HealthCare, and guidelines for the Partnership Health Plan Partners in Palliative Care Program developed by Robert Moore, MD, Chief Medical Officer.

4 This language is intended to distinguish between patients undergoing well-tolerated and effective treatment (early palliative care) and patients for whom treatment is not effective or well-tolerated (SB 1004 palliative care). Examples of this situation cited by the Advanced Illness Management (AIM) palliative care model include: ineffective chemotherapy or radiation for cancer; refractory fluid overload for CHF; severe or frequent exacerbations of COPD. Note that in lieu of "appropriate patient-desired medical therapy," the Sharp Transitions Guidelines indicate that "patients should have received maximum medical therapy," according to the Medicare definition of maximum medical therapy, which includes any of the following: 1) No further traditional therapy is available, 2) Patient is intolerant to further therapy, 3) Patient declines further therapy, 4) Patient repeatedly decompensates due to severe non-compliance." This criteria is also permissible under SB 1004.
outpatient disease management/palliative care instead of first going to the emergency department; and
b. Participate in Advance Care Planning discussions.

B. Disease-Specific Eligibility Criteria

1. Congestive Heart Failure (CHF): Must meet (a) and (b)
   a. The beneficiary is hospitalized due to CHF as the primary diagnosis with no further invasive interventions planned or meets criteria for the New York Heart Association’s (NYHA) heart failure classification III or higher;\(^5\)
   and
   b. The beneficiary has an Ejection Fraction of less than 30 percent for systolic failure or significant co-morbidities.

2. Chronic Obstructive Pulmonary Disease (COPD): Must meet (a) or (b)
   a. The beneficiary has a Forced Expiratory Volume (FEV)\(_{1}\) less than 35 percent of predicted and a 24-hour oxygen requirement of less than three liters per minute; or
   b. The beneficiary has a 24-hour oxygen requirement of greater than or equal to three liters per minute.

3. Advanced Cancer: Must meet (a) and (b)
   a. The beneficiary has a stage III or IV solid organ cancer, lymphoma, or leukemia; and
   b. The beneficiary has a Karnofsky Performance Scale (KPS) score less than or equal to 70\(^6\) or has failure of two lines of standard of care therapy (chemotherapy or radiation therapy).

4. Liver Disease: Must meet (a) and (b) combined or (c) alone
   a. The beneficiary has evidence of irreversible liver damage, serum albumin less than 3.0, and International Normalized Ratio (INR) greater than 1.3, and
   b. The beneficiary has ascites, subacute bacterial peritonitis, hepatic encephalopathy, hepatorenal syndrome, or recurrent esophageal varices; or
   c. The beneficiary has evidence of irreversible liver damage and has a Model for End Stage Liver Disease (MELD) score of greater than 19.\(^7\)

Beneficiaries with serious illness who are receiving services under SB 1004 palliative care may choose to transition to hospice care if they meet the medical prognosis for hospice, or, if they also continue to meet the medical eligibility criteria for SB 1004, may remain in SB 1004 palliative care.

---

\(^7\) MELD score calculator is available at: https://optn.transplant.hrsa.gov/resources/allocation-calculators/meld_calculator
care until their death. Beneficiaries with medical conditions that improve or stabilize, but still meet the eligibility criteria for SB 1004, may have palliative care services reduced as determined by medical necessity, but should continue to receive periodic assessments to monitor for a change in condition or needed services.

Note that research supports additional conditions for palliative care referral, and some MCPs are already authorizing palliative care consults and services for patients with other medical conditions. This policy reflects the minimum eligibility criteria for SB 1004 palliative care patients; MCPs would continue to have discretion to authorize palliative care services for patients with other medical conditions in addition to the four listed

Further, across existing palliative care programs in California, clinical eligibility criteria varies, and several approaches have been successful in improving patient satisfaction and health outcomes in a cost-effective manner for patients with serious illness. As a result, MCPs may propose alternative eligibility protocols for DHCS review. Those protocols may be no more restrictive, in terms of the eligible conditions, than the criteria listed above.

In addition, as noted on page 1 above, research indicates that beneficiaries diagnosed with serious illness have improved patient satisfaction and receive care better aligned with their preferences when they have early palliative care services, such as advance care planning, early in the disease progression. As a result, MCPs should consider working with specialists in targeted practice areas such as oncology and cardiology, so that early palliative care, particularly advance care planning, is offered to beneficiaries diagnosed with serious illness but who are not enrolled in SB 1004 palliative care.

Section 3: Services

DHCS policy provides that Medi-Cal palliative care include the eight services listed below, when reasonable and necessary for the palliation or management of a qualified serious illness and related conditions, when provided by a qualified provider, and when provided according to existing Medi-Cal regulations, Provider Manuals, Provider Bulletins, or All-Plan Letters for the specific service. All of the services below, except for chaplain services, are included in existing Medi-Cal benefits.

A. Palliative Care Services:

Effective January 1, 2018, when a beneficiary meets the minimum eligibility criteria for palliative care, MCPs must authorize palliative care without regard to age. Palliative care must include, at a minimum, the following seven services when medically necessary and reasonable for the palliation or management of a qualified serious illness and related conditions:

1. Advance Care Planning: Advance care planning for beneficiaries enrolled in Medi-Cal palliative care under SB 1004 includes documented discussions between a physician or other qualified healthcare professional and a patient, family member, or legally-recognized decision-maker. Counseling that takes place during these discussions addresses, but is not limited to, advance directives, such as Physician Orders for Life-Sustaining Treatment (POLST)
2. Palliative Care Assessment and Consultation: Palliative care assessment and consultation services may be provided at the same time as advance care planning or in subsequent patient conversations. The palliative care consultation aims to collect both routine medical data and additional personal information not regularly included in a medical history or Health Risk Assessment. During an initial and/or subsequent palliative care consultation or assessment, topics may include, but are not limited to:

- Treatment plans, including palliative care and curative care
- Pain and medicine side effects
- Emotional and social challenges
- Spiritual concerns
- Patient goals
- Advance directives, including POLST forms
- Legally recognized decision maker

3. Plan of Care: A plan of care should be developed with the engagement of the beneficiary and/or his/her representative(s) in its design. If a beneficiary already has a plan of care, that plan should be updated to reflect any changes resulting from the palliative care consultation or advance care planning discussion. A beneficiary’s plan of care must include all authorized palliative care, including but not limited to pain and symptom management and curative care. The plan of care must not include services already received through another Medi-Cal funded benefit program.10

4. Palliative Care Team: The palliative care team is a group of individuals who work together to meet the physical, medical, psychosocial, emotional, and spiritual needs of beneficiaries and their families and are able to assist in identifying sources of pain and discomfort of the beneficiary. This may include problems with breathing, fatigue, depression, anxiety, insomnia, bowel or bladder, dyspnea, nausea, etc. The palliative care team will also address other issues such as medication services and allied health. The team members must provide all authorized palliative care. DHCS recommends that the palliative care team include, but is not limited to the following team members, a doctor of medicine or osteopathy (Primary Care Provider if MD or DO), a registered nurse, a licensed vocational nurse or nurse practitioner (Primary Care Provider if NP), and a social

8 POLST forms are available at: http://capolst.org/
10 Examples include, but are not limited to, APL 13-014; California Children’s Services Numbered Letter 06-1011; Managed Care Policy Letter 11-004.
worker. Chaplain Services: DHCS recommends that MCPs provide access to chaplain services as part of the palliative care team. Chaplain services provided as palliative care are not reimbursable through the Medi-Cal program.

5. Care Coordination: A member of the palliative care team should provide coordination of care, ensure continuous assessment of the beneficiary’s needs, and implement the plan of care.

6. Pain and Symptom Management: Adequate pain and symptom management is an essential component of palliative care. Prescription drugs, physical therapy and other medically necessary services may be needed to address beneficiary pain and other symptoms. The beneficiary’s plan of care must include all services authorized for pain and symptom management.

7. Mental Health and Medical Social Services: Counseling and social services must be available to the beneficiary to assist in minimizing the stress and psychological problems that arise from a serious illness, related conditions, and the dying process. Counseling services facilitated by the palliative care team may include, but are not limited to: psychotherapy, bereavement counseling, medical social services, and discharge planning as appropriate. Provision of medical social services shall not duplicate specialty mental health services (SMHS) provided by county Mental Health Plans (MHPs) and does not change the MCP’s responsibilities for referring to, and coordinating with, county MHPs as delineated in APL 13-021.11

8. Recommended Service: **24/7 Telephonic Palliative Care Support** (separate from a routine advice line).

Many palliative care programs include specialized telephonic support. This service is recommended, but not required for MCPs, due to initial program development constraints.

Additional notes on palliative care services:

- Identification of the specific palliative care services needed for an individual beneficiary is dependent on a palliative care consult and/or needs assessment process. Palliative care services should be aligned with the needs and decisions of the beneficiary.

- Research and discussions with palliative care experts indicate that the full range of palliative care services (physical, social, spiritual, and emotional) should be available

---

to achieve the intended results in quality and cost-effectiveness measures.

- DHCS encourages MCPs and providers to provide palliative care consultations and services in a manner that meets beneficiaries’ cultural needs. Resources and technical assistance on culturally sensitive palliative care is an emerging field, and DHCS supports further training and development in this area.

B. Curative Care/Disease Modifying Care:

As specified in SB 1004, beneficiaries electing not to enroll in hospice care but who meet the eligibility criteria for SB 1004 Medi-Cal palliative care may access both palliative care and curative care services that are medically necessary, as specified in current Medi-Cal statute and regulation. Essential to care coordination, the palliative care team and a plan of care will ensure coordination between curative care and palliative care services, particularly including the beneficiary’s Primary Care Provider.

Section 4: Providers

MCPs may authorize palliative care to be provided in a variety of settings, including, but not limited to, inpatient, outpatient, or community-based settings. MCPs must utilize qualified providers for palliative care based on the setting and needs of a beneficiary so long as the MCP ensures that its providers comply with existing Medi-Cal contracts and policy. DHCS recommends that MCPs use providers with current palliative care training and/or certification to conduct palliative care consultations or assessments.

MCPs may contract with hospitals, long-term care facilities, clinics, hospice agencies, home health agencies, and other types of community-based providers that include licensed clinical staff with experience and/or training in palliative care. MCPs may contract with different types of providers depending on local provider qualifications and the need to reflect the diversity of their membership. Community-Based Adult Services (CBAS) facilities may be considered as a palliative care partner for facilitating advance care planning or palliative care referrals. Palliative care provided in a beneficiary’s home must comply with existing Medi-Cal requirements for in-home providers, services, and authorization, such as physician assessments and care plans. MCPs must inform and educate providers regarding availability of the palliative care benefit.

Also, DHCS is authorized to expend up to $244,000 for palliative care provider training, and will provide further guidance on this funding and training to Medi-Cal providers. In particular, DHCS recommends that providers of palliative care consultations or assessments have current palliative care training or certification.

Further, results from existing palliative care programs highlight the importance of developing provider referral and education processes, as well as consumer information about palliative care. DHCS recommends that MCPs develop provider and consumer outreach plans when implementing SB 1004 palliative care programs.

Section 5: Monitoring Outcomes and Performance Measures
To track results from SB 1004, DHCS will require MCPs to periodically provide lists of SB 1004 palliative care beneficiary participants to the Department. Further guidance will be provided on any MCP requirements for additional data reporting, such as inpatient stays, emergency department visits, or hospice enrollment, as well as quality measures.

Behavioral Counseling to Prevent Skin Cancer
US Preventive Services Task Force
Recommendation Statement

US Preventive Services Task Force

**Importance** Skin cancer is the most common type of cancer in the United States. Although invasive melanoma accounts for only 2% of all skin cancer cases, it is responsible for 80% of skin cancer deaths. Basal and squamous cell carcinoma, the 2 predominant types of nonmelanoma skin cancer, represent the vast majority of skin cancer cases.

**Objective** To update the 2012 US Preventive Services Task Force (USPSTF) recommendation on behavioral counseling for the primary prevention of skin cancer and the 2009 recommendation on screening for skin cancer with skin self-examination.

**Evidence Review** The USPSTF reviewed the evidence on whether counseling patients about sun protection reduces intermediate outcomes (eg, sunburn or precursor skin lesions) or skin cancer; the link between counseling and behavior change, the link between behavior change and skin cancer incidence, and the harms of counseling or changes in sun protection behavior; and the link between counseling patients to perform skin self-examination and skin cancer outcomes, as well as the harms of skin self-examination.

**Findings** The USPSTF determined that behavioral counseling interventions are of moderate benefit in increasing sun protection behaviors in children, adolescents, and young adults with fair skin types. The USPSTF found adequate evidence that behavioral counseling interventions result in a small increase in sun protection behaviors in adults older than 24 years with fair skin types. The USPSTF found inadequate evidence on the benefits and harms of counseling adults about skin self-examination to prevent skin cancer.

**Conclusions and Recommendation** The USPSTF recommends counseling young adults, adolescents, children, and parents of young children about minimizing exposure to UV radiation for persons aged 6 months to 24 years with fair skin types to reduce their risk of skin cancer. (B recommendation) The USPSTF recommends that clinicians selectivley offer counseling to adults older than 24 years with fair skin types about minimizing their exposure to UV radiation to reduce risk of skin cancer. Existing evidence indicates that the net benefit of counseling all adults older than 24 years is small. In determining whether this service is appropriate in individual cases, patients and clinicians should consider the presence of risk factors for skin cancer. (C recommendation) The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of counseling adults about skin self-examination to prevent skin cancer. (I statement)
The US Preventive Services Task Force (USPSTF) makes recommendations about the effectiveness of specific clinical preventive services for patients without obvious related signs or symptoms.

It bases its recommendations on the evidence of both the benefits and harms of the service and an assessment of the balance. The USPSTF does not consider the costs of providing a service in this assessment.

The USPSTF recognizes that clinical decisions involve more considerations than evidence alone. Clinicians should understand the evidence but individualize decision making to the specific patient or situation. Similarly, the USPSTF notes that policy and coverage decisions involve considerations in addition to the evidence of clinical benefits and harms.

**Summary of Recommendations and Evidence**

The USPSTF recommends counseling young adults and children, and parents of young children about minimizing exposure to UV radiation for persons aged 6 months to 24 years with fair skin types to reduce their risk of skin cancer (B recommendation) (Figure 1).

The USPSTF recommends that clinicians selectively offer counseling to adults older than 24 years with fair skin types about minimizing their exposure to UV radiation to reduce risk of skin cancer. Existing evidence indicates that the net benefit of counseling all adults older than 24 years is small. In determining whether counseling is appropriate in individual cases, patients and clinicians should consider the presence of risk factors for skin cancer. (C recommendation)

See the Clinical Considerations section for information on risk assessment.

The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of counseling adults about skin self-examination to prevent skin cancer. (I statement)

See the Clinical Considerations section for suggestions for practice regarding the I statement.

**Rationale**

**Importance**

Skin cancer is the most common type of cancer in the United States and is generally categorized as melanoma or nonmelanoma skin cancer. Melanoma is the fifth-leading type of incident cancer, and 2.2% of adults will be diagnosed with it in their lifetime. Although invasive melanoma accounts for only 2% of all skin cancer cases, it is responsible for 80% of skin cancer deaths. Basal and squamous cell carcinoma, the 2 predominant types of nonmelanoma skin cancer, represent the vast majority of skin cancer cases. There were an estimated 3.3 million new cases of nonmelanoma skin cancer in 2012 and an estimated 91,270 new cases of melanoma skin cancer in 2018.

**Recognition of Risk Status**

Exposure to UV radiation during childhood and adolescence increases the risk of skin cancer later in life, especially when more severe damage occurs, such as with severe sunburns. Persons with fair skin types (ivory or pale skin, light hair and eye color, freckles, or those who sunburn easily) are at increased risk of skin cancer. Persons who use tanning beds and those with a history of sunburns or previous skin cancer are also at substantially increased risk of skin cancer. Other factors that further increase risk include an increased number of nevi (moles) and atypical nevi, family history of skin cancer, HIV infection, and history of receiving an organ transplant. Most studies of interventions to increase sun protection behaviors have been limited to persons with fair skin types.

**Benefits of Behavioral Counseling Interventions**

Behavioral counseling interventions target sun protection behaviors to reduce UV radiation exposure. UV radiation is a known carcinogen that damages DNA and causes most skin cancer cases. A substantial body of observational evidence demonstrates that the strongest connection between UV radiation exposure and skin cancer results from exposure in childhood and adolescence. Sun protection behaviors include the use of broad-spectrum sunscreen with a sun-protection factor of 15 or greater, wearing hats, sunglasses, or sun-protective clothing; avoiding sun exposure seeking shade during midday hours (10 AM to 4 PM); and avoiding indoor tanning bed use.

The USPSTF found adequate evidence that behavioral counseling interventions available in or referable from a primary care setting result in a moderate increase in the use of sun protection behaviors for persons aged 6 months to 24 years with fair skin types.

The USPSTF found adequate evidence that behavioral counseling interventions available in or referable from a primary care setting result in a small increase in the use of sun protection behaviors for persons older than 24 years with fair skin types.

The USPSTF found insufficient evidence regarding the benefits of counseling adults about skin self-examination to prevent skin cancer.

**Harms of Behavioral Counseling Interventions**

The USPSTF found adequate evidence that the harms related to behavioral counseling interventions and sun protection behaviors in young persons or adults are small. The USPSTF found inadequate evidence regarding the harms of counseling adults about skin self-examination.

**USPSTF Assessment**

The USPSTF concludes with moderate certainty that behavioral counseling interventions have a moderate net benefit for young adults, adolescents, and children aged 6 months to 24 years with fair skin types.

The USPSTF concludes with moderate certainty that behavioral counseling interventions have a small benefit in adults older than 24 years with fair skin types.

The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of counseling adults about skin self-examination.

**Clinical Considerations**

**Patient Population Under Consideration**

This recommendation applies to asymptomatic persons without a history of skin cancer (Figure 2). Because most trials of skin cancer...
counseling predominantly include persons with fair skin types, the USPSTF limited its recommendation to this population.

**Assessment of Risk**

Persons with fair skin types (ivory or pale skin, light eye color, red or blond hair, freckles, those who sunburn easily) are at increased risk of skin cancer and should be counseled. Other factors that further increase risk include a history of sunburns, previous use of indoor tanning beds, and a family or personal history of skin cancer. Persons with an increased number of nevi and atypical nevi are at increased risk of melanoma. Persons with a compromised immune system (eg, persons living with HIV, persons who have received an organ transplant) are at increased risk of skin cancer.

**Behavioral Counseling Interventions**

All studies conducted in children and adolescents focused on sun protection behaviors, most were directed at parents, and some provided child-specific materials or messages. Half of the interventions included face-to-face counseling, and all included...

| Risk Assessment | Ultraviolet radiation exposure during childhood and adolescence increases risk of skin cancer later in life, especially when severe damage occurs. Persons with fair skin type (light hair and eye color, freckles, those who sunburn easily) are at increased risk of skin cancer. Persons who use tanning beds and those with a history of sunburns or previous skin cancer are also at greatly increased risk of skin cancer. Other factors that increase risk include an increased number of nevi (moles) and atypical nevi, family history of skin cancer, HIV infection, and history of receiving an organ transplant. |

| Behavioral Counseling Interventions | Behavioral counseling interventions target sun protection behaviors to reduce UV radiation exposure, including use of broad-spectrum sunscreen with a sun-protection factor of 15 or greater, wearing hats, sunglasses, or sun-protective clothing; avoiding sun exposure; seeking shade during midday hours (10 AM to 4 PM); and avoiding indoor tanning use. |

| Other Relevant USPSTF Recommendations | The USPSTF has issued a recommendation on screening for skin cancer in adults. |

### U.S. Preventive Services Task Force

USPSTF indicates US Preventive Services Task Force.

---

print materials. Three studies provided the intervention in conjunction with well-child visits. The majority of studies conducted in young adults and adults focused on improving sun protection behaviors, and 2 studies used "appearance-focused" messages. The mode of delivery varied and included mail-based, face-to-face or telephone counseling, and technology-based (text messages, online programs and modules, personal UV facial photographs) interventions.2

---

**Suggestions for Practice Regarding the I Statement**

**Potential Preventable Burden**

Counseling adults about performing skin self-examination appears to result in an increase of such examinations. The potential benefit of behavioral counseling about skin self-examination is uncertain because of the lack of evidence on the link between behavior change and skin cancer or other health outcomes. In addition, there is no evidence about the incremental benefit that might occur with skin self-examination above the benefit from counseling for sun protection behaviors and from current levels of skin examinations being performed by clinicians.

**Potential Harms**

Skin self-examination is performed by the patient and is noninvasive. Psychosocial harms, such as anxiety or cancer worry, are possible. If skin self-examination leads to biopsy, procedural harms such as pain, bleeding, scarring, or infection could occur.7

---

**Current Practice**

The frequency of behavioral counseling for skin self-examination in the asymptomatic population is not well known.

**Additional Approaches to Prevention**

The Community Preventive Services Task Force recommends child care center-based, primary and middle school-based, and multicomponent community-wide interventions for the prevention of skin cancer.8 These interventions combine school- and community-based communications and policy to increase preventive behaviors (eg, covering up, using shade, or avoiding the sun during peak UV hours) among certain populations in specific settings.

The US Food and Drug Administration (FDA) provides information to help guide patients and clinicians regarding sun protection and the use and effectiveness of broad-spectrum sunscreen.9 The FDA has determined that broad-spectrum sunscreens with a sun protection factor of 15 or greater, reapplied at least every 2 hours, protect against both UVA and UVB radiation and reduce the risk of skin cancer and early skin aging. The FDA also provides consumer education materials on the dangers of indoor tanning.10

The Environmental Protection Agency provides a variety of educational tools regarding sun safety, including state-specific information, and interactive widgets and smartphone applications that forecast UV exposure by zip code or city. It also provides sun safety fact sheets and handouts, including age-appropriate materials.11
Useful Resources
The USPSTF has issued a recommendation on screening for skin cancer in adults. 12

Other Considerations
Implementation
Interventions included tailored mailings, print materials, and in-person counseling by health professionals. Interventions for children were directed mostly toward parents; some materials were child-specific. Counseling interventions for children, their parents, or both provided messages focused on increasing sun protection behaviors (e.g., using sunscreen, avoiding midday sun, wearing sun-protective clothing). Some print-based interventions included materials tailored to the child’s risk level, barriers to change, self-efficacy, or other factors. Health professionals providing in-person counseling included primary care clinicians and health educators.

One trial of an intervention involving children 3 years and younger used clinician counseling and print materials for parents promoting child sun protection with sun protection aids (sunscreen samples and hat). 13 Several trials in children aged 3 to 10 years used standard or tailored mailings over 1 to 36 months. 14-17 One study also included a DVD in addition to standard mailing promoting sun protection. One trial used a 1-day, in-person parent education session with a children’s video, print materials, and sun protection aids (shirt, hat, and sunscreen). For the single study in adolescents, clinicians directly counseled participants with 4 follow-up telephone counseling sessions by a health educator over 18 months; mailed materials and sunscreen samples were also used.

In the 16 trials among adults, interventions included a variety of messages and components, conducted in a range of settings. 1,4 Technology-based interventions included an interactive web program and tailored text messages on sun protection, as well as appearance-focused print materials. The web program study reported reduced sunburns after the intervention, which provided information on topics such as indoor tanning, UV radiation exposure and health, skin cancer, sunscreen, and skin examination. Each module took about 10 minutes to complete and included a goal-setting section. Other interventions that increased sun protection behaviors in adults included mailed print materials containing personalized risk feedback and recommendations, self-monitoring aids for UV exposure, and skin cancer prevention and detection information, individualized computer reports, and an interactive educational computer program on skin cancer prevention that provided individual feedback on personal risk of skin cancer.

Research Needs and Gaps
A better understanding of the effectiveness of counseling on the use of sun protection behaviors in adults 25 years and older is needed to address the key evidence gap on counseling for this age group. Research that evaluates the association between UV exposure during adulthood and skin cancer risk would also be valuable.

In addition, studies regarding the effectiveness of counseling persons without a fair skin type are lacking. Ideally, research studies would provide measurements of sun exposure, sunburn, precursory skin lesions, and cancer among large trial populations, with an emphasis on behaviors and health outcomes among persons who receive an intervention focused on sun protection behaviors. Such studies would also assess whether these behaviors continue after trial completion. These cohorts should include populations with diverse skin colors and should include adolescents, young adults, and preschool-aged children and their parents. These studies may be used to further develop technologies and vehicles for administering relevant interventions for behavior change in the primary care setting, especially among nonwhite persons, young adults, and persons who practice indoor or outdoor tanning. Further evidence is needed to assess the balance of benefits and harms of counseling adults about skin self-examination to prevent skin cancer and premature death.

Discussion
Burden of Disease
Skin cancer is the most common type of cancer. Melanoma is less common than basal or squamous cell carcinoma but has a much higher death rate. In 2018, an estimated 91,270 new cases of melanoma were expected, representing 5.2% of all new cancer cases. 1 An estimated 97,300 persons will die of the disease, representing 1.6% of all cancer deaths. 15 Although age-adjusted incidence rates have increased from 1989 to 2014 (from 13.7 to 25.2 cases per 100,000 persons), the death rate has remained fairly stable over the same period (from 2.7 to 2.6 deaths per 100,000 persons). 16 Adults older than 50 years; men; and persons with fair skin types are at increased risk. Melanoma is most frequently diagnosed among adults aged 65 to 74 years; death rates are highest among the middle-aged and elderly. Melanoma is 5 times more common among Hispanic adults and 25 times more common among white than African American adults. 17

Nonmelanoma skin cancer, of which most cases are basal and squamous cell skin cancer, is associated with a substantial burden to the patient but rarely results in death. Basal cell skin cancer constitutes about 80% of nonmelanoma skin cancer cases, and squamous cell skin cancer constitutes about 20%. In general, nonmelanoma skin cancer accounts for a small percentage of all cancer deaths, mostly in older adults or persons with a compromised immune system. An estimated 2,000 persons die from nonmelanoma skin cancer each year. 6 The true prevalence of nonmelanoma skin cancer is difficult to estimate because it is not a required cancer for registry entry; an estimated 5.4 million cases were diagnosed in 3.3 million persons in 2012. 6

Scope of Review
The USPSTF commissioned a systematic evidence review to update its 2012 recommendation on behavioral counseling for the primary prevention of skin cancer 19 and its 2009 recommendation on screening for skin cancer with skin self-examination. 20 The review focused on direct evidence that counseling patients about sun protection reduces intermediate outcomes (e.g., sunburn or precursor skin lesions) or skin cancer. The review also sought evidence on the link between counseling and behavior change, the link between behavior change and skin cancer incidence, and the harms of counseling or changes in sun protection behavior. In addition, the review...
examined evidence regarding counseling patients to perform skin self-examination and skin cancer outcomes and the harms of skin self-examination.

**Effectiveness of Behavioral Counseling Interventions to Change Behavior**

Many counseling interventions were found to be moderately effective in modifying sun protection behaviors among children, adolescents, and young adults but less effective in adults. Both traditional cancer prevention and appearance-focused messages (i.e., stressing the aging effects of UV radiation on the skin) increased sun protection behaviors compared with control groups.

Of the 6 trials that evaluated the effect of interventions on sun protection behaviors among children and adolescents, 5 reported a statistically significant improvement in parent-reported composite scores of child sun protection behaviors compared with control groups.\(^{19,16,27-29}\) Four of the 6 trials specifically targeted children aged 3 to 10 years, 1 trial focused on children from birth to 3 years, and 1 trial focused on adolescents aged 11 to 15 years. Among the 4 trials in children aged 3 to 10 years, 3 showed statistically significant differences in changes in sun protection behavior and sunscreen use at 3 months to 3 years of follow-up.\(^{14-16}\)

A cluster randomized clinical trial\(^{20}\) that provided counseling to parents of newborns in a series of 4 well-child visits showed statistically significant improvement in composite sun protection scores in the intervention group. However, most individual measures were not statistically significant, and it was difficult to determine the clinical relevance of the small improvements. An in-person counseling intervention targeting adolescents and involving clinicians and health educators showed that sun protection scores were higher in the intervention group than in the control group at 2 years of follow-up.\(^{21}\)

Adequate evidence of the effectiveness of counseling interventions was found in 2 of the 3 high-quality trials conducted among young adults. In a web-based study of 18- to 25-year-olds, participants viewed an interactive 12-module web program featuring 10-minute topics such as indoor tanning, UV exposure and health, skin cancer, and skin examination.\(^{22}\) At 3 months of follow-up, there was significant improvement in past-month UV exposure and sun protection behaviors, sunscreen use, outdoor tanning, and skin self-examination. Another study (a randomized clinical trial) used a video intervention, with or without UV facial photography; the intervention showed no effect on composite sun protection scores.\(^{23}\) In the third young adult study, women who used indoor tanning were given a 24-page booklet that detailed the effects of UV radiation and indoor tanning and appearance-enhancing alternatives to indoor tanning. At 6 months of follow-up, there was a significantly smaller increase in indoor tanning sessions in the past 3 months in the intervention group than in the control group.\(^{24}\)

Evidence of the effectiveness of counseling interventions in adults older than 24 years is mixed. Six of 12 trials that addressed sun protection behavior composite scores in adults found an increase in such behaviors compared with control groups.\(^{2,26}\) Three of these interventions promoted sun protection with tailored mailings, 2 used interactive online programs, and 2 used tailored text messages. Four of 7 trials assessing sunscreen use found an increase in this outcome. Of 3 trials of self-reported indoor tanning behavior, only 1 trial using an appearance-focused intervention among young female adults noted a significant improvement compared with the control group.\(^{24}\) Effective interventions were more often of longer duration or had more frequent contacts with participants during the study period.

Trials of counseling interventions that focused on counseling patients to perform skin self-examination as a means of reducing skin cancer risk were inconclusive. A trial with more than 1300 participants showed that those who received a skin self-examination counseling intervention did not have significant differences in the incidence of skin cancer cases or atypical new compared with those in the control group at 12 months of follow-up.\(^{25}\) Several studies showed that skin self-examination interventions increase the likelihood of participants reporting that they perform skin self-examination.\(^{2,26}\) Additional studies are needed to determine the direct effect of skin self-examination on skin cancer risk.

**Link Between Behavior Change and Cancer Risk**

**Sun Exposure**

Total and recreational sun exposure during childhood is associated with increased melanoma risk. Studies that measured long-term or total sun exposure showed mixed association between increased sun exposure and skin cancer risk. Several fair- to good-quality studies demonstrated a link between adult recreational exposure to UV radiation and increased melanoma risk.\(^{3}\) One large population-based study showed increased risk of both melanoma incidence and melanoma death with higher quartiles of UV exposure.\(^{27}\) Two recent meta-analyses and 2 cohort studies also showed an increased risk of nonmelanoma skin cancer in persons with increased exposure to ambient UV radiation.\(^{2}\)

**Indoor Tanning**

Indoor tanning is associated with increased melanoma risk, and younger age at first indoor tanning exposure increases this risk.\(^{27}\) A meta-analysis provided evidence of a dose-response relationship between melanoma risk and indoor tanning in women younger than 50 years.\(^{28}\) Four studies found that increasing indoor tanning frequency was associated with increased melanoma risk. Two systematic reviews, 1 cohort study, and 1 case-control study found evidence that having ever used indoor tanning was associated with increased risk of squamous cell and basal cell carcinoma compared with never having used indoor tanning.\(^{29-32}\)

**Sunscreen Use**

Two studies in adults provided new evidence of a protective effect of sunscreen use. One study, which was considered by the USPSTF for its previous recommendation statement, analyzed long-term follow-up data from a randomized clinical trial. In this study, intervention group participants applied sunscreen daily, while control group participants continued their usual behavior. At 4.5 years, the intervention group had a decreased risk of squamous cell carcinoma.\(^{33}\) Ten years after conclusion of the trial, the intervention group had half as many incident melanomas as the control group. Overall, melanoma risk was reduced in the intervention group compared with the control group and was most pronounced for invasive melanoma compared with in situ melanoma.\(^{24}\) A large US case-control study also demonstrated a lower likelihood of melanoma in persons routinely using sunscreen compared with those who do not.\(^{29}\)
Skin Self-Examination and Health Outcomes
Evidence on the effectiveness of skin self-examination in reducing death or illness is lacking. One 20-year follow-up study showed no association between skin self-examination and skin cancer death.15

Potential Harms of Behavioral Counseling Interventions
Potential harms of interventions promoting sun protection behaviors include skin reactions to sunscreen lotion, vitamin D deficiency, reduced physical activity due to avoiding the outdoors, and a paradoxical increase in sun exposure from a false reassurance of protection from sunscreen use. Sunscreen use can be associated with numerous transient skin reactions, including allergic, irritant, and phototoxic contact dermatitis. Although vitamin D deficiency is a hypothetical harm of sun avoidance, recent studies have not shown an association between sunscreen use and decreased vitamin D levels. Among the sparse evidence available, 1 study suggested that sun protection behaviors do not lead to decreased physical activity or increased body mass index.37 Older studies reported that sunscreen use did not result in an intentional increase in sun exposure, but 2 recent studies showed that sunscreen use was associated with higher likelihood of multiple sunburns.38

Persons who performed skin self-examination were more likely to subsequently undergo a skin procedure compared with those who did not, as evidenced by 1 trial, indicating a potential harm of skin self-examination. Although melanoma death rates have remained stable, the increasing number of skin biopsies and rising melanoma incidence over recent decades provide evidence for overdiagnosis.39

Estimate of Magnitude of Net Benefit
The USPSTF determined that behavioral counseling interventions are of moderate benefit in increasing sun protection behaviors in children, adolescents, and young adults with fair skin types. The link of behavior change to outcomes is supported by several trials and a substantial body of observational evidence showing that the strongest connection between UV radiation exposure and skin cancer stems from exposure in childhood and adolescence. Evidence of a connection between sun exposure in adulthood and melanoma is less robust than in childhood. The USPSTF found adequate evidence that the harms related to counseling or sun protection behaviors are small. The USPSTF concludes with moderate certainty that the net benefit of counseling to decrease UV exposure and reduce skin cancer risk is moderate in children, adolescents, and young adults aged 6 months to 24 years.

The USPSTF found adequate evidence that behavioral counseling interventions result in a small increase in sun protection behaviors in adults older than 24 years. The harms of counseling are small. The USPSTF determined that the evidence supporting a link between decreased UV exposure in adulthood and skin cancer risk is adequate. The USPSTF concludes with moderate certainty that the net benefit of counseling to decrease UV exposure and reduce skin cancer risk is small in adults older than 24 years.

The USPSTF found inadequate evidence on the benefits and harms of counseling adults about skin self-examination to prevent skin cancer. Therefore, the USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of counseling adults about skin self-examination to prevent skin cancer.

How Does Evidence Fit With Biological Understanding?
UV radiation from both solar and artificial sources has been classified as a human carcinogen by national and international organizations. Epidemiologic evidence suggests that the effect of UV radiation exposure from typical doses of sunlight varies over the life span, with some evidence of a window of biological vulnerability in childhood and adolescence that translates into increased skin cancer risk later in life. Much of the available evidence concerns the most common skin lesions, nonmelanomatous neoplasia and basal cell and squamous cell cancer. It remains unclear whether the same mechanisms apply to melanoma risk. For all 3 types of cancer, increasing intermittent or recreational sun exposure and total sun exposure are linked to increased risk. Artificial UV radiation, specifically indoor tanning, is also associated with an increased risk of skin cancer. Indoor tanning before age 35 years, for more than 10 tanning sessions over a lifetime, and for longer than 1 year have been linked to increased cancer risk.

Response to Public Comments
A draft version of this recommendation statement was posted for public comment on the USPSTF website from October 10 to November 6, 2017. In response to public comments, the USPSTF clarified the definition of fair skin type for the purposes of this recommendation. Comments requested more details about the behavioral counseling interventions, and the USPSTF provided additional information on implementation strategies. Several comments requested clarification about why skin self-examination is included in this recommendation; the USPSTF clarified that this recommendation addresses several preventive counseling interventions, including evidence about primary care clinicians counseling patients to perform skin self-examination. The USPSTF also added suggestions for practice regarding the statement, information on newer technologies, and further information on the evidence for the different age ranges in the recommendations.

Update of Previous USPSTF Recommendation
This recommendation replaces the 2012 USPSTF recommendation on counseling about skin cancer prevention19 and the skin self-examination portion of the 2009 USPSTF recommendation on screening for skin cancer.20 In this updated recommendation, the USPSTF expanded the age range for behavioral counseling interventions to include persons aged 6 months to 24 years with fair skin types (the previous recommendation applied to persons aged 10 to 24 years, based on the evidence available at that time). Recent studies in children younger than 10 years resulted in the USPSTF extending the lower end of the age range to 6 months, the minimum age recommended for sunscreen use. Based on additional evidence since the prior recommendation, the USPSTF now also recommends that clinicians consider selectively offering counseling to adults older than 24 years with fair skin types. As in 2012, the evidence on persons without a fair skin type remains insufficient for this population to be included in the recommendation statement. The evidence continues to be insufficient to assess the balance of benefits and harms of counseling adults about skin self-examination to prevent skin cancer, as it was in 2009.
Recommendations of Others

The US Surgeon General,40 American Cancer Society,41 American College of Obstetricians and Gynecologists,42 American Academy of Pediatrics,43 Royal Australian College of General Practitioners,44 and the World Health Organization's International Agency for Research on Cancer45 endorse the involvement of clinicians in counseling patients about skin cancer prevention.

The Community Preventive Services Task Force recommends education and policy approaches to encourage sun protection behaviors in child care centers, schools, recreational sites, and occupational settings. In addition, it recommends community-wide interventions that may or may not involve health care settings to increase protection behavior from UV radiation. Interventions include mass media campaigns and environmental and policy changes across multiple settings within a defined geographic area or an entire community.

The American Academy of Dermatology encourages everyone to perform skin self-examination to check for signs of skin cancer.46 The American Cancer Society47 and the Skin Cancer Foundation48 recommend monthly skin self-examination.

Funding/Support: The USPSTF is an independent, voluntary body. The US Congress mandates that the Agency for Healthcare Research and Quality (AHRQ) support the operations of the USPSTF.

Role of the Funder/Sponsor: AHRQ staff assisted in the following: development and review of the research plan, commission of the systematic evidence review from an Evidence-Based Practice Center, coordination of expert review and public comment of the draft evidence report and draft recommendation statement, and the writing and preparation of the final recommendation statement and its submission for publication. AHRQ staff had no role in the approval of the final recommendation statement or the decision to submit for publication.

Disclaimer: Recommendations made by the USPSTF are independent of the US government. They should not be construed as an official position of AHRQ or the US Department of Health and Human Services.

Additional Contributions: We thank Ernest Sullivent, MD, MPH (AHRQ), who contributed to the writing of the manuscript, and Lisa Niccolle, MA (AHRQ), who assisted with coordination and editing.

<td>------------</td>
</tr>
<tr>
<td>Cancer screening</td>
<td>Adults ages 55 to 80 years who have a 30 pack-year smoking history and currently smoke or have quit within the past 15 years. Screening should be discontinued once a person has not smoked for 15 years or develops a health problem that substantially limits life expectancy or the ability or willingness to have curative lung surgery.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Obesity screening and counseling: adults</td>
<td>The USPSTF recommends screening all adults for obesity. Clinicians should offer or refer patients with a body mass index of 30 kg/m² or higher to intensive, multicomponent behavioral interventions.</td>
<td>B</td>
<td>June 2012*</td>
</tr>
<tr>
<td>Obesity screening: children and adolescents</td>
<td>The USPSTF recommends that clinicians screen for obesity in children and adolescents 6 years and older and offer or refer them to comprehensive, intensive behavioral interventions to promote improvements in weight status.</td>
<td>B</td>
<td>June 2017*</td>
</tr>
<tr>
<td>Osteoporosis screening: women</td>
<td>The USPSTF recommends screening for osteoporosis in women age 65 years and older and in younger women whose fracture risk is equal to or greater than that of a 65-year-old white woman who has no additional risk factors.</td>
<td>B</td>
<td>January 2012*</td>
</tr>
<tr>
<td>Phenylketonuria screening: newborns</td>
<td>The USPSTF recommends screening for phenylketonuria in newborns.</td>
<td>B</td>
<td>March 2008</td>
</tr>
<tr>
<td>Preventive Service</td>
<td>Recommendation</td>
<td>Source Date</td>
<td></td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------</td>
<td>--------------</td>
<td></td>
</tr>
<tr>
<td><strong>Preeclampsia prevention: aspirin</strong></td>
<td>The USPSTF recommends the use of low-dose aspirin (81 mg/d) as preventive medication after 12 weeks of gestation in women who are at high risk for preeclampsia.</td>
<td>B September 2014</td>
<td></td>
</tr>
<tr>
<td><strong>Preeclampsia: screening</strong></td>
<td>The USPSTF recommends screening for preeclampsia in pregnant women with blood pressure measurements throughout pregnancy.</td>
<td>B April 2017</td>
<td></td>
</tr>
<tr>
<td><strong>Rh incompatibility screening: first pregnancy visit</strong></td>
<td>The USPSTF strongly recommends Rh (D) blood typing and antibody testing for all pregnant women during their first visit for pregnancy-related care.</td>
<td>A February 2004</td>
<td></td>
</tr>
<tr>
<td><strong>Rh incompatibility screening: 24–28 weeks' gestation</strong></td>
<td>The USPSTF recommends repeated Rh (D) antibody testing for all unsensitized Rh (D)-negative women at 24 to 28 weeks' gestation, unless the biological father is known to be Rh (D)-negative.</td>
<td>B February 2004</td>
<td></td>
</tr>
<tr>
<td><strong>Sexually transmitted infections counseling</strong></td>
<td>The USPSTF recommends intensive behavioral counseling for all sexually active adolescents and for adults who are at increased risk for sexually transmitted infections.</td>
<td>B September 2014*</td>
<td></td>
</tr>
<tr>
<td><strong>Skin cancer behavioral counseling</strong></td>
<td>The USPSTF recommends counseling young adults, adolescents, children, and parents of young children about minimizing exposure to ultraviolet (UV) radiation for persons aged 6 months to 24 years with fair skin types to reduce their risk of skin cancer.</td>
<td>B March 2018*</td>
<td></td>
</tr>
<tr>
<td>Statin preventive medication: adults ages 40–75 years with no history of CVD, 1 or more CVD risk factors, and a calculated 10-year CVD event risk of 10% or greater</td>
<td>The USPSTF recommends that adults without a history of cardiovascular disease (CVD) (i.e., symptomatic coronary artery disease or ischemic stroke) use a low-to moderate-dose statin for the prevention of CVD events and mortality when all of the following criteria are met: 1) they are ages 40 to 75 years; 2) they have 1 or more CVD risk factors (i.e., dyslipidemia, diabetes, hypertension, or smoking); and 3) they have a calculated 10-year risk of a cardiovascular event of 10% or greater. Identification of dyslipidemia and calculation of 10-year CVD event risk requires universal lipids screening in adults ages 40 to 75 years.</td>
<td>B November 2016*</td>
<td></td>
</tr>
<tr>
<td>Tobacco use counseling and interventions: nonpregnant adults</td>
<td>The USPSTF recommends that clinicians ask all adults about tobacco use, advise them to stop using tobacco, and provide behavioral interventions and U.S. Food and Drug Administration (FDA)–approved pharmacotherapy for cessation to adults who use tobacco.</td>
<td>A September 2015*</td>
<td></td>
</tr>
<tr>
<td>Tobacco use counseling: pregnant women</td>

<th>Description</th>
<th>Grade</th>
<th>Release Date of Current Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abdominal aortic aneurysm screening: men</td>
<td>The USPSTF recommends one-time screening for abdominal aortic aneurysm by ultrasonography in men ages 65 to 75 years who have ever smoked.</td>
<td>B</td>
<td>June 2014*</td>
</tr>
<tr>
<td>Alcohol misuse: screening and counseling</td>
<td>The USPSTF recommends that clinicians screen adults age 18 years or older for alcohol misuse and provide persons engaged in risky or hazardous drinking with brief behavioral counseling interventions to reduce alcohol misuse.</td>
<td>B</td>
<td>May 2013*</td>
</tr>
<tr>
<td>Aspirin preventive medication: adults aged 50 to 59 years with a ≥10% 10-year cardiovascular risk</td>
<td>The USPSTF recommends initiating low-dose aspirin use for the primary prevention of cardiovascular disease and colorectal cancer in adults aged 50 to 59 years who have a 10% or greater 10-year cardiovascular risk, are not at increased risk for bleeding, have a life expectancy of at least 10 years, and are willing to take low-dose aspirin daily for at least 10 years.</td>
<td>B</td>
<td>April 2016*</td>
</tr>
<tr>
<td>Bacteriuria screening: pregnant women</td>
<td>The USPSTF recommends screening for asymptomatic bacteriuria with urine culture in pregnant women at 12 to 16 weeks' gestation or at the first prenatal visit, if later.</td>
<td>A</td>
<td>July 2008</td>
</tr>
<tr>
<td>Blood pressure screening: adults</td>
<td>The USPSTF recommends screening for high blood pressure in adults aged 18 years or older. The USPSTF recommends obtaining measurements outside of the clinical setting for diagnostic confirmation before starting treatment.</td>
<td>A</td>
<td>October 2015*</td>
</tr>
<tr>
<td>BRCA risk assessment and genetic counseling/testing</td>
<td>The USPSTF recommends that primary care providers screen women who have family members with breast, ovarian, tubal, or peritoneal cancer with one of several screening tools designed to identify a family history that may be associated with an increased risk for potentially harmful mutations in breast cancer susceptibility genes (BRCA1 or BRCA2). Women with positive screening results should receive genetic counseling and, if indicated after counseling, BRCA testing.</td>

<td>Date</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------</td>
<td>------------</td>
</tr>
<tr>
<td><strong>Breast cancer preventive medications</strong></td>
<td>The USPSTF recommends that clinicians engage in shared, informed decisionmaking with women who are at increased risk for breast cancer about medications to reduce their risk. For women who are at increased risk for breast cancer and at low risk for adverse medication effects, clinicians should offer to prescribe risk-reducing medications, such as tamoxifen or raloxifene.</td>
<td>B</td>
<td>September 2013*</td>
</tr>
<tr>
<td><strong>Breast cancer screening</strong></td>
<td>The USPSTF recommends screening mammography for women, with or without clinical breast examination, every 1 to 2 years for women age 40 years and older.</td>
<td>B</td>
<td>September 2002†</td>
</tr>
<tr>
<td><strong>Breastfeeding interventions</strong></td>
<td>The USPSTF recommends providing interventions during pregnancy and after birth to support breastfeeding.</td>
<td>B</td>
<td>October 2016*</td>
</tr>
<tr>
<td><strong>Cervical cancer screening</strong></td>
<td>The USPSTF recommends screening for cervical cancer in women ages 21 to 65 years with cytology (Pap smear) every 3 years or, for women ages 30 to 65 years who want to lengthen the screening interval, screening with a combination of cytology and human papillomavirus (HPV) testing every 5 years.</td>
<td>A</td>
<td>March 2012*</td>
</tr>
<tr>
<td><strong>Chlamydia screening: women</strong></td>
<td>The USPSTF recommends screening for chlamydia in sexually active women age 24 years or younger and in older women who are at increased risk for infection.</td>
<td>B</td>
<td>September 2014*</td>
</tr>
<tr>
<td><strong>Colorectal cancer screening</strong></td>
<td>The USPSTF recommends screening for colorectal cancer starting at age 50 years and continuing until age 75 years.</td>
<td>A</td>
<td>June 2016*</td>
</tr>
<tr>
<td><strong>Dental caries prevention: infants and children up to age 5 years</strong></td>
<td>The USPSTF recommends the application of fluoride varnish to the primary teeth of all infants and children starting at the age of primary tooth eruption in primary care practices. The USPSTF recommends primary care clinicians prescribe oral fluoride supplementation starting at age 6 months for children whose water supply is fluoride deficient.</td>
<td>B</td>
<td>May 2014*</td>
</tr>
<tr>
<td><strong>Depression screening: adolescents</strong></td>
<td>The USPSTF recommends screening for major depressive disorder (MDD) in adolescents aged 12 to 18 years. Screening should be implemented with adequate systems in place to ensure accurate diagnosis, effective treatment, and appropriate follow-up.</td>
<td>B</td>
<td>February 2016*</td>
</tr>
<tr>
<td><strong>Depression screening: adults</strong></td>
<td>The USPSTF recommends screening for depression in the general adult population, including pregnant and postpartum women. Screening should be implemented with adequate systems in place to ensure accurate diagnosis, effective treatment, and appropriate follow-up.</td>
<td>B</td>
<td>January 2016*</td>
</tr>
<tr>
<td><strong>Diabetes screening</strong></td>
<td>The USPSTF recommends screening for abnormal blood glucose as part of cardiovascular risk assessment in adults aged 40 to 70 years who are overweight or obese. Clinicians should offer or refer patients with abnormal blood glucose to intensive behavioral counseling interventions to promote a healthful diet and physical activity.</td>
<td>B</td>
<td>October 2015*</td>
</tr>
<tr>
<td><strong>Falls prevention in older adults: exercise or physical therapy</strong></td>
<td>The USPSTF recommends exercise or physical therapy to prevent falls in community-dwelling adults age 65 years and older who are at increased risk for falls.</td>
<td>B</td>
<td>May 2012</td>
</tr>
<tr>
<td><strong>Falls prevention in older adults: vitamin D</strong></td>
<td>The USPSTF recommends vitamin D supplementation to prevent falls in community-dwelling adults age 65 years and older who are at increased risk for falls.</td>
<td>B</td>
<td>May 2012</td>
</tr>
<tr>
<td>Condition / Screening</td>
<td>Recommendation</td>
<td>Date</td>
<td></td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------</td>
<td>------</td>
<td></td>
</tr>
<tr>
<td>Folic acid supplementation</td>
<td>The USPSTF recommends that all women who are planning or capable of pregnancy take a daily supplement containing 0.4 to 0.8 mg (400 to 800 µg) of folic acid.</td>
<td>January 2017*</td>
<td></td>
</tr>
<tr>
<td>Gestational diabetes mellitus screening</td>
<td>The USPSTF recommends screening for gestational diabetes mellitus in asymptomatic pregnant women after 24 weeks of gestation.</td>
<td>January 2014</td>
<td></td>
</tr>
<tr>
<td>Gonorrhea prophylactic medication: newborns</td>
<td>The USPSTF recommends prophylactic ocular topical medication for all newborns for the prevention of gonococcal ophthalmia neonatorum.</td>
<td>July 2011*</td>
<td></td>
</tr>
<tr>
<td>Gonorrhea screening: women</td>
<td>The USPSTF recommends screening for gonorrhea in sexually active women age 24 years or younger and in older women who are at increased risk for infection.</td>
<td>September 2014*</td>
<td></td>
</tr>
<tr>
<td>Healthy diet and physical activity counseling to prevent cardiovascular disease: adults with cardiovascular risk factors</td>
<td>The USPSTF recommends offering or referring adults who are overweight or obese and have additional cardiovascular disease (CVD) risk factors to intensive behavioral counseling interventions to promote a healthful diet and physical activity for CVD prevention.</td>
<td>August 2014*</td>
<td></td>
</tr>
<tr>
<td>Hemoglobinopathies screening: newborns</td>
<td>The USPSTF recommends screening for sickle cell disease in newborns.</td>
<td>September 2007</td>
<td></td>
</tr>
<tr>
<td>Hepatitis B screening: nonpregnant adolescents and adults</td>
<td>The USPSTF recommends screening for hepatitis B virus infection in persons at high risk for infection.</td>
<td>May 2014</td>
<td></td>
</tr>
<tr>
<td>Hepatitis B screening: pregnant women</td>
<td>The USPSTF strongly recommends screening for hepatitis B virus infection in pregnant women at their first prenatal visit.</td>
<td>June 2009</td>
<td></td>
</tr>
<tr>
<td>Hepatitis C virus infection screening: adults</td>
<td>The USPSTF recommends screening for hepatitis C virus (HCV) infection in persons at high risk for infection. The USPSTF also recommends offering one-time screening for HCV infection to adults born between 1945 and 1965.</td>
<td>June 2013</td>
<td></td>
</tr>
<tr>
<td>HIV screening: nonpregnant adolescents and adults</td>
<td>The USPSTF recommends that clinicians screen for HIV infection in adolescents and adults ages 15 to 65 years. Younger adolescents and older adults who are at increased risk should also be screened.</td>
<td>April 2013*</td>
<td></td>
</tr>
<tr>
<td>HIV screening: pregnant women</td>
<td>The USPSTF recommends that clinicians screen all pregnant women for HIV, including those who present in labor who are untested and whose HIV status is unknown.</td>
<td>April 2013*</td>
<td></td>
</tr>
<tr>
<td>Hypothyroidism screening: newborns</td>
<td>The USPSTF recommends screening for congenital hypothyroidism in newborns.</td>
<td>March 2008</td>
<td></td>
</tr>
<tr>
<td>Intimate partner violence screening: women of childbearing age</td>
<td>The USPSTF recommends that clinicians screen women of childbearing age for intimate partner violence, such as domestic violence, and provide or refer women who screen positive to intervention services. This recommendation applies to women who do not have signs or symptoms of abuse.</td>
<td>January 2013</td>
<td></td>
</tr>

<tr>
<td>Lung cancer screening</td>
<td>The USPSTF recommends annual screening for lung cancer with low-dose computed tomography in adults ages 55 to 80 years who have a 30 pack-year smoking history and currently smoke or have quit within the past 15 years. Screening should be discontinued once a person has not smoked for 15 years or develops a health problem that substantially limits life expectancy or the ability or willingness to have curative lung surgery.</td>
<td>B</td>
<td>December 2013</td>
</tr>
<tr>
<td>Obesity screening and counseling: adults</td>
<td>The USPSTF recommends screening all adults for obesity. Clinicians should offer or refer patients with a body mass index of 30 kg/m² or higher to intensive, multicomponent behavioral interventions.</td>
<td>B</td>
<td>June 2012*</td>
</tr>
<tr>
<td>Obesity screening: children and adolescents</td>
<td>The USPSTF recommends that clinicians screen for obesity in children and adolescents 6 years and older and offer or refer them to comprehensive, intensive behavioral interventions to promote improvements in weight status.</td>
<td>B</td>
<td>June 2017*</td>
</tr>
<tr>
<td>Osteoporosis screening: women</td>
<td>The USPSTF recommends screening for osteoporosis in women age 65 years and older and in younger women whose fracture risk is equal to or greater than that of a 65-year-old white woman who has no additional risk factors.</td>
<td>B</td>
<td>January 2012*</td>
</tr>
<tr>
<td>Phenylketonuria screening: newborns</td>
<td>The USPSTF recommends screening for phenylketonuria in newborns.</td>
<td>B</td>
<td>March 2008</td>
</tr>
<tr>
<td>Preeclampsia prevention: aspirin</td>
<td>The USPSTF recommends the use of low-dose aspirin (81 mg/d) as preventive medication after 12 weeks of gestation in women who are at high risk for preeclampsia.</td>
<td>B</td>
<td>September 2014</td>
</tr>
<tr>
<td>Preeclampsia: screening</td>
<td>The USPSTF recommends screening for preeclampsia in pregnant women with blood pressure measurements throughout pregnancy.</td>
<td>B</td>
<td>April 2017</td>
</tr>
<tr>
<td>Rh incompatibility screening: first pregnancy visit</td>
<td>The USPSTF strongly recommends Rh (D) blood typing and antibody testing for all pregnant women during their first visit for pregnancy-related care.</td>
<td>A</td>
<td>February 2004</td>
</tr>
<tr>
<td>Rh incompatibility screening: 24–28 weeks' gestation</td>
<td>The USPSTF recommends repeated Rh (D) antibody testing for all unsensitized Rh (D)-negative women at 24 to 28 weeks' gestation, unless the biological father is known to be Rh (D)-negative.</td>
<td>B</td>
<td>February 2004</td>
</tr>
<tr>
<td>Sexually transmitted infections counseling</td>
<td>The USPSTF recommends intensive behavioral counseling for all sexually active adolescents and for adults who are at increased risk for sexually transmitted infections.</td>
<td>B</td>
<td>September 2014*</td>
</tr>
<tr>
<td>Skin cancer behavioral counseling</td>
<td>The USPSTF recommends counseling children, adolescents, and young adults ages 10 to 24 years who have fair skin about minimizing their exposure to ultraviolet radiation to reduce risk for skin cancer.</td>
<td>B</td>
<td>May 2012</td>
</tr>
<tr>
<td>Statin preventive medication: adults ages 40–75 years with no history of CVD, 1 or more CVD risk factors, and a calculated 10-year CVD event risk of 10% or greater</td>
<td>The USPSTF recommends that adults without a history of cardiovascular disease (CVD) (i.e., symptomatic coronary artery disease or ischemic stroke) use a low- to moderate-dose statin for the prevention of CVD events and mortality when all of the following criteria are met: 1) they are ages 40 to 75 years; 2) they have 1 or more CVD risk factors (i.e., dyslipidemia, diabetes, hypertension, or smoking); and 3) they have a calculated 10-year risk of a cardiovascular event of 10% or greater. Identification of dyslipidemia and calculation of 10-year CVD event risk requires universal lipids screening in adults ages 40 to 75 years.</td>
<td>B</td>
<td>November 2016*</td>
</tr>
<tr>
<td>Tobacco use counseling and interventions: nonpregnant adults</td>
<td>The USPSTF recommends that clinicians ask all adults about tobacco use, advise them to stop using tobacco, and provide behavioral interventions and U.S. Food and Drug Administration (FDA)–approved pharmacotherapy for cessation to adults who use tobacco.</td>
<td>A</td>
<td>September 2015*</td>
</tr>
<tr>
<td>Tobacco use counseling: pregnant women</td>
<td>The USPSTF recommends that clinicians ask all pregnant women about tobacco use, advise them to stop using tobacco, and provide behavioral interventions for cessation to pregnant women who use tobacco.</td>
