Contra Costa County Emergency Medical Services

Universal Patient Care

**Treatment Guideline G01**

**Contra Costa County Emergency Medical Services**

**Universal Patient Care**

**Required Vital Signs:**
- Blood pressure as age appropriate
- Palpated pulse rate
- Respiratory rate
- Pulse oximetry

If indicated:
- Blood glucose
- 12-Lead ECG
- Lung sounds
- Temperature
- Pain scale
- **EtCO₂ monitoring**

### Trauma Patient
- Evaluate mechanism of injury
- Consider spinal motion restriction **if indicated**
- High Risk Mechanism
- Primary and secondary trauma assessment
- Obtain VS
- Obtain SAMPLE

### Medical Patient
- Mental status
- Unresponsive
- Primary and secondary assessment
- Obtain history of present illness from available sources / scene survey

### Trauma Patient
- Low Risk Mechanism
- Primary and secondary trauma assessment
- Focused assessment on specific injury
- Obtain VS

### Medical Patient
- Responsive
- Chief complaint
- Obtain SAMPLE
- Primary and secondary assessment
- Focused assessment on specific complaint
- Obtain VS

### Trauma Patient
- Primary and secondary trauma assessment
- Focused assessment on specific injury
- Exit to appropriate TG

### Medical Patient
- Repeat assessment while preparing for transport
- Continue on-going assessment
- Repeat VS
- Evaluate interventions / procedures
- Patient transfer to hospital staff
- Include summary of care and patient property

- Trauma patient does not fit specific TG

**Notify receiving facility.**
**Contact Base Hospital for medical direction, as needed.**

**Exit to appropriate TG**

**Effective Jan. 2020**
Scene Safety Evaluation: Identify potential hazards to prehospital providers, patient, and public. Identify number of patients and utilize triage protocol if indicated. Observe patient position and surroundings.

General: All patient care must be appropriate to the provider level of training and documented in the EHR. The EHR narrative should be considered a story of the circumstances, events, and care of the patient and should allow the reader to understand the complaint, assessment, treatment, why procedures were performed, and why indicated procedures were not performed as well as ongoing assessments and response to treatment and interventions.

Adult Patient: An adult should be suspected of being acutely hypotensive when systolic blood pressure is less than 90mmHg. Diabetic patients and women may have atypical presentations of cardiac-related problems such as MI. General weakness can be the symptom of a very serious underlying process. Beta blockers and other cardiac drugs may prevent a reflexive tachycardia in shock with low to normal pulse rates.

Geriatric Patient: Hip fractures and dislocations have high mortality rates. Altered mental status is not always dementia. Always check BGL and assess for signs for stroke, trauma, etc. with any alteration in a patient’s baseline mental status. Minor or moderate injury in the typical adult may be very serious in the elderly.

Pediatric Patient: A pediatric patient is defined by those <15 years of age. Initial assessment should utilize the Pediatric Assessment Triangle which encompasses appearance, work of breathing, and circulation to skin. The order of assessment may require alteration dependent on the developmental state of the patient. Generally, the child or infant should not be separated from the caregiver unless absolutely necessary during assessment and treatment.

Patient Refusal: Patient refusal is a high risk situation. Encourage the patient to accept transport to a medical facility. Encourage the patient to allow an assessment, including vital signs. Documentation of the event is very important including a mental status assessment describing the patient’s capacity to refuse care. Guide to assessing capacity:

  Patient should be able to communicate a clear choice: This should remain stable over time. Inability to communicate a choice or an inability to express the choice consistently demonstrates incapacity.

  Relevant information is understood: Patient should be able to display a factual understanding of their illness or situation that requires further medical attention, the options, and risks and benefits.

  Appreciation of the situation: Ability to communicate an understanding of the facts of the situation. Patient should be able to describe the significance of the potential outcome from his or her decision.

  Manipulation of information in a rational manner: Demonstrate a rational process to come to a decision. Should be able to describe the reasoning they are using to come to the decision, whether or not the EMS provider agrees with the decision.

Special note on oxygen administration and utilization: Oxygen in prehospital patient care is probably over utilized. Oxygen is a pharmaceutical drug with indications, contraindications as well as untoward side effects. Utilize oxygen when indicated, not because it is available. A reasonable target oxygen saturation for most patients is ≥ 94% regardless of delivery device.

Pearls

- A pediatric patient is defined as being <15 years of age.
- Timing of transport should be based on the patient’s condition and the destination policy.
- Never hesitate to contact the Base Hospital as a high risk refusal resource for any patient who refuses transport.
- SAMPLE: Signs / Symptoms; Allergies; Medications; PMH; Last oral intake; Events leading to injury/illness.
**History**
- Terminal illness
- Hospice care
- POLST or DNR
- Death with Dignity attestation

**Signs and Symptoms**
- AMS
- Congestion
- Change in breathing
- Change in pulse
- Fever

**Differential**
- Natural end of life
- Medication OD

---

EMS may be summoned by family for a patient who has taken a lethal dose of medication under the Death with Dignity Act.

Respect the patient’s wishes, but if family objects and requests intervention or transport, initiate comfort care.

Review POLST, DNR, or Death with Dignity Final Attestation form (if present). Honor wishes listed on legal form

If needed, provide comfort care:
- Oxygen
- Open and maintain the airway using non-invasive means *only* (e.g. chin lift or jaw thrust)
- Suction as necessary

**Form present and family objects**
Provide comfort care and contact the Base Hospital to have physician speak with family.

**Do not start resuscitation if the patient is in cardiopulmonary arrest**

**Administration of Naloxone is not advised**

Notify receiving facility. Contact Base Hospital for medical direction, as needed.

---

**Pearls**
- Patients who have been deemed terminally ill by two independent physicians have the right under the California End of Life Act to end their life with dignity at a time that they choose themselves. EMS personnel should be aware of and familiar with this act. Refer to Policy 1003 for additional information.
- Naxolone will not have an affect on the drugs prescribed for death with dignity patients.
- It is important to recognize that families may be educated on what to expect with a dying family member, but no amount of preparation can eliminate the stress and grief of watching a loved one die.
- Contact the Base Hospital for direction or assistance with family if necessary.
Contra Costa County Emergency Medical Services

End of Life Care

History
- Terminal illness
- Hospice care
- POLST or DNR

Signs and Symptoms
- AMS
- Congestion
- Change in breathing
- Change in pulse
- Fever

Differential
- Natural end of life
- Medication OD

If needed, provide immediate supportive care
- Oxygen
- Open and maintain the airway using non-invasive means only (e.g., chin lift or jaw thrust)
- Suction as necessary
- Position for comfort
- Control external hemorrhaging
- Immobilize obvious fractures using techniques to minimize pain

Review POLST or DNR form
Honor wishes listed on legal form

Honor and respect patient/family wishes for transport after discussion

Is the patient on hospice?
- Yes
- No

Administration of Naloxone is not advised

Determine level of pain and treat if indicated

If an existing patent IV is available
Fentanyl 25 – 200mcg IV
titrated in 25 – 50mcg increments to pain relief. Consider 25mcg increments in elderly patients

If no IV access
Fentanyl 100mcg IN
May repeat once after 15 minutes

If no IV access and IN route not advisable
Fentanyl 50 – 100mcg IM
May repeat once after 15 minutes

Max of 200mcg total
Monitor and reassess 5 minutes following administration
If transport is declined, complete Refusal and thoroughly document encounter

Notify receiving facility. Contact Base Hospital for medical direction, as needed.

If family member with decision-making authority is not present, ask family for the phone number for their Hospice Nurse if not already on scene

Contact Hospice Nurse
Let Hospice Nurse discuss options with family, even if only over the phone
The family and Hospice Nurse should decide on an appropriate course of treatment or decision to transport
Transport to appropriate receiving center or requested facility of choice

Fentanyl
Contact Base Hospital for additional order

PEARLS

- Hospice patients and those on palliative end of life care are often heavily medicated with pain medications. Administration of Naxolone, even in small amounts, can result in unnecessary suffering.

- Follow the wishes outlined in a signed POLST or DNR order. A competent patient or designated decision maker acting on behalf of the patient can overide POLST.

- If a POLST or DNR order is not immediately available, immediately initiate BLS supportive care. Do not delay care while waiting for the form.

- If transport is initiated at the request of the family and the patient subsequently goes into cardiac or respiratory arrest during transport, continue to the closest approved receiving facility.

- Always involve the patient’s assigned Hospice Nurse, even if it is by phone. It is important to recognize that families may be educated on what to expect with a dying family member, but no amount of preparation can eliminate the stress and grief of watching a loved one die.

- Contact the Base Hospital for direction or assistance with family in the absence of a Hospice Nurse if necessary.

POLST forms are generally copied on pink paper to help ensure that the document stands out and is followed. However, POLST on any paper color is valid.

Unlike POLST, there is no standardized DNR order form. If you have doubt of a DNR order authenticity, initiate BLS care and contact the Base Hospital for guidance.
**History**
- Age
- Duration of fever
- Severity of fever
- Past medical history
- Medications
- Immunocompromised (transplant, HIV, diabetes, cancer)
- Environmental exposure
- Recent travel to emerging infectious disease affected regions
- Time of last acetaminophen or ibuprofen

**Signs and Symptoms**
- Warm
- Flushed appearance
- Sweaty
- Chills

**Associated symptoms (helpful to localize source)**
- Myalgia, cough, chest pain, headache, dysuria, abdominal pain, mental status changes, rash

**Differential**
- Infections/sepsis
- Cancer/tumors/lymphomas
- Medication or drug reaction
- Connective tissue disease
  - Arthritis
  - Vasculitis
- Hyperthyroidism
- Heat stroke
- Meningitis or other airborne disease
- Emerging infectious disease

---

**Pearls**
- **UTILIZE UNIVERSAL PRECAUTIONS FOR ALL PATIENTS WITH SUSPECTED INFECTION.**
- Febrile seizures are more likely in children with a history of febrile seizures and may be caused by a rapid elevation in temperature.
- **All-hazards precautions** include standard PPE plus airborne and contact precautions. This level of precaution is utilized during the initial phases of an outbreak when the etiology of the infection is unknown or when the causative agent is found to be highly contagious (e.g. Ebola, MERS, SARS).
- **Droplet precautions** include standard PPE plus a standard surgical mask for providers who accompany patients in the back of the ambulance and a surgical mask or NRB O₂ mask for the patient. This level of precaution should be utilized when influenza, meningitis, mumps, streptococcal pharyngitis and other illnesses spread via large particle droplets are suspected. A patient with a potentially infectious rash should be treated with droplet precautions.
- **Contact precautions** include standard PPE plus utilization of a gown, change of gloves after every patient contact and strict hand washing precautions. This level of precaution is utilized when multi-drug resistant organisms (e.g. MRSA and VRE), scabies, herpes zoster (shingles), or other illnesses spread by contact are suspected.
- Rehydration with fluids increases the patient’s ability to sweat and improves temperature control.
First circulatory access for cardiac arrest?

Yes

Establish IV/IO

No

Assess need for IV
Emergent or potentially emergent medical or trauma condition

Saline lock

Peripheral IV

Intraosseous IV for life-threatening event at most suitable site available

External jugular IV for unstable patients needing emergent IV medication or fluids AND no peripheral site is available AND IO is not obtainable

Monitor saline lock/existing approved prehospital fluids

Monitor infusion

Pearls

- In the setting of cardiac arrest, any preexisting dialysis shunt or external central venous catheter may be used.
- In patients who are hemodynamically unstable, pre-existing indwelling central lines can be used to deliver fluid and medications.
- Approved prehospital IV solutions include: Isotonic (balanced) saline solution, Ringer’s lactate, and glucose solutions with no additional additives.
- Any working venous catheter already accessed prior to EMS arrival may be used for EMS IV fluids and medications.
- Use Chlorhexidine for all IV/IO attempts.
- Intraosseous access should be obtained only with the appropriate adult or pediatric device (e.g. IO drill).
- Any prehospital fluids or medications approved for IV use may also be given through IO.
- External jugular access is only indicated for patients ≥ 15 years of age.
- All IV rates should be kept at TKO (minimal rate to keep the vein open) unless administering fluid bolus.
- Use micro drip sets for all patients 6 years of age and less.
- Upper extremity IV sites are preferable to lower extremity sites; lower extremity sites are discouraged in patients with vascular disease or diabetes.
- In post-mastectomy patients and patients with a working dialysis fistula, avoid IV attempts, injections and blood pressure measurements in the upper extremity on the affected side.
Because there may be no palpable pulse, utilize other parameters for patient assessment (e.g., LOC, skin signs, capillary refill and EtCO₂).

Assess the patient

Assess the device

Cardiac arrest or if patient is unresponsive and the VAD is functioning

Begin continuous chest compressions

If the patient’s condition appears to be related to their VAD, and it is safe and reasonable, it is preferred to transport the patient to their Bay Area VAD Center unless the patient has any of the following conditions, which warrant transport to a closer hospital:

- Minor medical or trauma with adequate perfusion
- Suspected stroke patients
- Suspected STEMI patients
- Suspected trauma patients

Notify receiving facility. Contact Base Hospital for medical direction, as needed.

Device information, implant center, and VAD Coordinator contact number may be located on the device itself, on the refrigerator, or medical alert bracelet

If a caregiver is present, yield to their advice.

The VAD Coordinator can assist you with determining the best course of action regarding assessment of the device. Only the Base Hospital is authorized to provide medical direction.

For continuous flow devices (no palpable pulse), auscultate the left upper quadrant of abdomen and listen for the “hum” of the device

Determine if the device has power

- If the device has power, it does not necessarily mean it is working properly
- If the device has power, you will see a green light on the Heartmate II, the most common device
- On the HeartWare device, the display will tell you the liters per minute of blood flow

Check the device for secure connections and properly charged batteries

If the pump is functioning, the problem is usually with the patient, not the device.

Exit to appropriate TG

Exit to appropriate TG and transport to any approved receiving facility

Exit to Suspected Stroke TG

Exit to Suspected STEMI TG

Exit to Trauma TGs

Bay Area VAD Centers
Stanford – Palo Alto
Lucille Packard – Palo Alto
California Pacific Med. Ctr. – SF
UC San Francisco – SF
Kaiser Santa Clara – Santa Clara
UC Davis - Davis

Pearls

- Patients may be cardioverted or defibrillated if symptomatic, but asymptomatic dysrhythmias do not require treatment.
- If a VAD patient is unconscious, begin continuous chest compressions.
- Treatment should follow appropriate treatment guidelines. Medical direction is provided by the Base Hospital only; VAD Coordinators cannot provide medical direction.
- Contact the Base Hospital if there are questions concerning destination.
- If possible, the patient’s family member or caregiver should accompany the patient in the ambulance, and all related VAD equipment, including spare batteries, should also be transported with the patient.
- In arrest situations, determine if a POLST/DNR or advanced directive is available. Many VAD patients have made end of life care decisions.
History
- Age
- Medications (e.g. Viagra, Sildenafil, Levitra, Vardenafil, Cialis or Tadalafil)
- Past medical history (e.g. MI, angina, diabetes, or post menopausal)
- Allergies
- Recent physical exertion
- Provocation
- Quality (e.g. pressure, constant, sharp, dull, etc.)
- Region/Radiation/Referred
- Severity (0 – 10 scale)
- Time (onset/duration/repetition)

Signs and Symptoms
- Heart rate < 60 with associated hypotension, acute altered mental status, chest pain, acute CHF, seizures, syncope, or shock secondary to bradycardia
- Chest pain
- Respiratory distress
- Hypotension or shock
- Altered mental status
- Syncope

Differential
- Acute myocardial infarction
- Hypoxia
- Pacemaker failure
- Hypothermia
- Sinus bradycardia
- Athletes
- Head injury (elevated ICP) or stroke
- Spinal cord lesion
- Sick sinus syndrome
- AV blocks (e.g. 1°, 2°, or 3°)
- Overdose

Pearls
- Patients with a STEMI needing interventional cardiac care require timely transfer. A scene time of 10 minutes or less at the sending facility is ideal.
- Treatment during interfacility transfer varies from field approach to chest pain/ACS:
  - Confirmatory ECG for a STEMI has already been done by the hospital and does not need to be repeated prior to transfer or during transport to receiving facility.
  - Nitroglycerin treatment is not required and is generally ineffective in patients with a confirmed STEMI.
  - Aspirin or other anti-platelet treatment, if indicated, should be administered by sending hospital prior to transport.
  - Patients generally will be directed to the cath lab upon arrival.
  - Outcome of STEMI patients is directly related to timeliness of intervention to relieve coronary artery occlusion. Minimizing time delay in transfer is essential.
**History**
- Age
- Medications (e.g. Viagra, Sildenafil, Levitra, Vardenafil, Cialis or Tadalafil)
- Past medical history
- Allergies

**Signs and Symptoms**
- Cardiac arrest
- Respiratory distress or respiratory failure
- Hypotension or shock
- Altered mental status

**Differential**
- Acute myocardial infarction
- Hypoxia
- Hypothermia
- Head injury (elevated ICP) or stroke
- Spinal cord lesion
- Overdose

**Pearls**
- Patients requiring specialty care, most commonly trauma or neurological care, may be transferred with an established endotracheal tube. Sedation may be required if patient agitation is present because of risk of inadvertent extubation.
- Some patients may need chemical paralysis and require additional nursing or physician staff to administer these medications.
- If inadvertent extubation occurs, manage with basic airway maneuvers unless ventilation cannot be adequately maintained.
History
- Previous stroke or TIA
- Previous cardiac or vascular surgery
- Associated diseases (diabetes, hypertension, CAD)
- Atrial fibrillation
- Medications (blood thinners)
- History of trauma

Signs and Symptoms
- Altered mental status
- Weakness or paralysis
- Blindness or other sensory loss
- Aphasia or dysarthria
- Syncope
- Vertigo or dizziness
- Vomiting
- Headache
- Seizure
- Respiratory pattern change
- Hypertension/hypotension

Differential
- See Altered Mental Status
- TIA
- Seizure
- Todd’s paralysis
- Hypoglycemia
- Stroke
  - Thrombotic or embolic (~85%)
  - Hemorrhagic (~15%)
- Tumor
- Trauma
- Dialysis or renal failure

Approved Stroke Receiving Centers
- John Muir – Concord
- John Muir – Walnut Creek
- Kaiser – Antioch
- Kaiser – Richmond
- Kaiser – Walnut Creek
- San Ramon Regional
- Eden – Castro Valley
- Kaiser – Oakland
- Kaiser – Vallejo
- Marin General
- Summit – Oakland
- Sutter – Solano

is

noted.

Pearls

- Stroke patients who are transferred may have already received thrombolytic therapy or may not have qualified for thrombolytics based on the length of time from stroke onset or other medical contraindications.
- Ongoing administration of thrombolytic therapy requires additional qualified staff (nurse or physician) for transport.
- Thrombolytic therapy in stroke patients is associated with around a 6% incidence of symptomatic intracerebral hemorrhage, and around 1% of serious hemorrhage elsewhere.
- Close monitoring of stroke patients is important. Significant changes in patient vital signs or GCS during transport should be reported immediately to receiving facility staff as it may affect immediate treatment:
  - Hypotension may occur because of external or internal hemorrhage.
  - Hypertension may be related to an acute intracranial process or underlying disease.
  - Respiratory depression or airway compromise may occur due to stroke or intracerebral hemorrhage.
  - Decreasing level of consciousness may occur due to stroke or intracerebral hemorrhage.
- Cardiac dysrhythmias may occur in stroke patients.
- Observe for external hemorrhage in patients who have received thrombolytic therapy. Place direct pressure if hemorrhage is noted.

Diagnosed with a stroke

**Cardiac Arrest**

**History**
- Code status (DNR or POLST)
- Events leading to arrest
- Estimated downtime
- History of current illness
- Past medical history
- Medications
- Existence of terminal illness

**Signs and Symptoms**
- Unresponsive
- Apneic
- Pulseless

**Differential**
- Medical vs. trauma
- VF vs. pulseless VT
- Asystole
- PEA
- Primary cardiac event vs. respiratory arrest or drug overdose

---

**Decomposition**
Rigor mortis
Dependent lividity

Injury incompatible with life or traumatic arrest with asystole
Do not begin resuscitation
Follow Policy 1004 – Determination of Death

**For suspected Excited Delirium patients**
Consider fluid bolus early and contact Base Hospital for Sodium Bicarbonate order

---

**AT ANY TIME**
Return of spontaneous circulation
Go to Post Resuscitation TG

---

**Criteria for death/no resuscitation**
Review DNR/POLST form

---

**Begin continuous chest compressions**
Push hard (> 2 inches) and fast (100-120/min)
Use metronome to ensure proper rate
Change compressors every 2 minutes (Limit changes/pulse checks to < 5 seconds)
Apply mechanical compression device if available

---

**For death/no resuscitation**
Yes

---

**ALS available?**
Yes

---

**E** Apply AED if available

**Shockable rhythm?**

**Shockable rhythm?**

---

**E** Automated defibrillation

**Continue CPR**
5 cycles over 2 minutes
Repeat and assess

**Follow Airway TG**

**Follow Airway TG**

---

Follow Asystole/PEA and Airway TG as indicated

Follow VF/VT and Airway TG as indicated

---

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.
**Pearls**

- Efforts should be directed at high quality and continuous chest compressions with limited interruptions. Consider early IO placement if available or direct IV access if anticipated.
- Passive ventilation for the first three cycles (6 minutes) of CPR. After that time, the patient should be ventilated using a BLS airway and BVM at a rate of 6 ventilation/minute (1:10 seconds) with continuous CPR.
- Placement of an advanced airway should be deferred unless a provider is unable to ventilate the patient with a BLS airway and BVM.
- Do not delay chest compressions while applying any device or intervention.
- Use a metronome during chest compression to ensure proper rate.
- In cases of clear-cut traumatic arrest, epinephrine is not indicated in PEA or asystole. Epinephrine will not correct arrest caused by a tension pneumothorax, cardiac tamponade, or hemorrhagic shock. If there is any doubt as to the cause of arrest, treat as a non-traumatic arrest.
- If a non-shockable rhythm persists for 30 minutes despite aggressive resuscitative efforts, consider cessation of efforts as outlined in the Determination of Death policy.
- The AutoPulse device is limited to 80 compressions/minute, which is acceptable when using this device during cardiac arrest.
- Resuscitation is based on proper planning and organized execution. Procedures require space and patient access. Make room to work. Utilize a team focused approach assigning responders to predetermined tasks.
- Reassess and document ETT placement and EtCO₂ frequently, after every move, and at transfer of care.
- Maternal arrest: Treat mother per appropriate TG with immediate notification to the Base Hospital along with rapid transport. Place pillows or padding underneath mother to displace fetus from inferior vena cava as to ensure continued fetal blood circulation; left lateral position. IV/IO access should be preferably placed above the diaphragm. Defibrillation is safe at all energy levels.
**History**
- Events leading to arrest
- Estimated downtime
- Past medical history
- Medications
- End stage renal disease
- Suspected hypothermia
- Suspected overdose
  - Tricyclic
  - Digitalis
  - Beta blockers
  - Calcium channel blockers
- DNR, POLST or living will

**Signs and Symptoms**
- Pulseless
- Apneic or agonal respirations

**Differential**
- Hypovolemia (e.g. trauma, AAA or other)
- Cardiac tamponade
- Hypothermia
- Drug overdose (e.g. tricyclic, digitalis, beta blockers, or calcium channel blockers)
- Massive myocardial infarction
- Hypoxia
- Tension pneumothorax
- Pulmonary embolus
- Acidosis
- Hyperkalemia

**AT ANY TIME**
- Return of spontaneous circulation
- Go to Post Resuscitation TG

**Decomposition**
- Rigor mortis
- Dependent lividity
- Injury incompatible with life or unwitnessed traumatic arrest with asystole
- Do not begin resuscitation
- Follow Policy 1004 – Determination of Death

**Search for reversible causes and treat appropriately**
- Establish IV/IO
- Normal Saline bolus 1000ml IV/IO
- Epinephrine (1:10,000) 1mg IV/IO
- Consider Chest Decompression Procedure

**Criteria for death / no resuscitation**
- Review DNR / POLST form
- Follow FP09 - Cardiac Arrest Management

**Resume chest compressions**
- Push hard (> 2 inches) and fast (100-120/min)
- Change compressors every 2 minutes (Limit changes/pulse checks to < 5 seconds)

**Shockable rhythm?**
- Yes
- No

**AT ANY TIME**
- Discontinue Resuscitation
- Follow Policy 1004 – Determination of Death

**Notify receiving facility.**
- Contact Base Hospital for medical direction, as needed.
Pearls
- Efforts should be directed at high quality and continuous chest compressions with limited interruptions and early defibrillation when indicated. Consider early IO placement if available or direct IV access if anticipated.
- Passive ventilation for the first three cycles (6 minutes) of CPR. After that time, the patient should be ventilated using a BLS airway and BVM at a rate of 6 ventilation/minute (1:10 seconds) with continuous CPR.
- Placement of an advanced airway should be deferred unless a provider is unable to ventilate the patient with a BLS airway and BVM.
- Use a metronome during chest compression to ensure proper rate.
- If a non-shockable rhythm persists for 30 minutes despite aggressive resuscitative efforts, consider cessation of efforts as outlined in the Determination of Death policy.
- The AutoPulse device is limited to 80 compressions/minute, which is acceptable when using this device during cardiac arrest.
- SURVIVAL FROM PEA OR ASYSTOLE is based on identifying and correcting the CAUSE: consider a broad differential diagnosis with early and aggressive treatment of possible causes.
- Potential association of PEA with hypoxia may exist, so placing an effective BLS airway with oxygenation early may provide benefit.
- PEA caused by sepsis or severe volume loss may benefit from higher volume of normal saline administration.
- Return of spontaneous circulation after Asystole/PEA requires continued search for underlying cause of cardiac arrest.
- Treatment of hypoxia and hypotension are important after resuscitation from Asystole/PEA.
- Asystole is commonly an end stage rhythm following prolonged VF or PEA with a poor prognosis.
- Discussion with the Base Hospital can be a valuable tool in developing a differential diagnosis and identifying possible treatment options.
AT ANY TIME

Return of spontaneous circulation

Go to Post Resuscitation TG

Reversible Causes
Hypovolemia
Hypoxia
Hydrogen ion (acidosis)
Hypothermia
Hypo/Hyperkalemia
Hypoglycemia
Tension pneumothorax
Tamponade (cardiac)
Toxins
Thrombosis (pulmonary)(PE)
Thrombosis (coronary)(MI)

Contra Costa County Emergency Medical Services
V-Fib/Pulseless V-Tach

Treatment Guideline AC 03

Page 1 of 2
PEARLS

- Efforts should be directed at high quality and continuous chest compressions with limited interruptions and early defibrillation when indicated. Consider early IO placement if available or direct IV access if anticipated.
- Passive ventilation for the first three cycles (6 minutes) of CPR. After that time, the patient should be ventilated using a BLS airway and BVM at a rate of 6 ventilation/minute (1:10 seconds) with continuous CPR.
- Placement of an advanced airway should be deferred unless a provider is unable to ventilate the patient with a BLS airway and BVM.
- Use a metronome during chest compression to ensure proper rate.
- If a non-shockable rhythm persists for 30 minutes despite aggressive resuscitative efforts, consider cessation of efforts as outlined in the Determination of Death policy.
- Contact Base Hospital prior to transport of non-ROSC patients.
- The AutoPulse device is limited to 80 compressions/minute, which is acceptable when using this device during cardiac arrest.
- Effective chest compressions and prompt defibrillation are the keys to successful resuscitation.
- Reassess and document ETT placement and EtCO₂ frequently, after every move, and at transfer of care.
- Do not stop chest compressions to check for placement of ETT or to give medications.

Contra Costa County Emergency Medical Services

Post Resuscitation (ROSC) Treatment Guideline AC04

Page 1 of 1

History
- Respiratory arrest
- Cardiac arrest

Signs and Symptoms
- Return of spontaneous circulation

Differential
- Continue to address specific differentials associated with the original dysrhythmia

Repeat primary assessment

Optimize ventilation and oxygenation
- Maintain SpO2 ≥ 94%
- Maintain respiratory rate between 6 – 10/minute for EtCO2 35 – 45
- DO NOT HYPERVENTILATE

Monitor vital signs

Advanced airway placement, if indicated

Obtain 12-Lead ECG

Establish IO/IV

Normal Saline bolus 500ml IV/IO
May repeat as needed if lungs are clear

Systolic BP < 90
Push Dose Epi 1 ml (10 mcg) IV/IO every 3 min
Titrate to a Systolic BP > 90
Cycle Blood Pressure every 3 minutes

Transport to STEMI Receiving Center

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.

Worsening bradycardia in ROSC patients may indicate impending rearrest

1:1000 Epinephrine Mixing Instructions

NEED:
1:1000 Epinephrine ampule
tuberculin syringe
10ml Normal Saline flush

1. Draw up 0.1ml (1 ml/mg) of 1:1000 Epi in the tuberculin syringe
2. Add the 1:1000 Epi from the tuberculin syringe into the Normal Saline flush - mix gently
3. Now you have 10mL of Epinephrine at a 0.01mg/mL (10mcg/mL) concentration
4. Label the syringe

1:10,000 Epinephrine Mixing Instructions

NEED:
1:10000 Epinephrine pre-load
10 ml Normal Saline flush

1. Waste 1 ml from Normal Saline Flush
2. Draw 1 ml of 0.1mg/mL (Epi 1:10000) from pre-load into Normal Saline Flush – mix gently
3. Now you have 10 ml of Epinephrine at a 0.01mg/mL (10mcg/mL) concentration
4. Label the syringe

Valley Care - Pleasanton
Contra Costa County Emergency Medical Services

Symptomatic Bradycardia

**History**
- Past medical history
- Medications
  - Beta blockers
  - Calcium channel blockers
  - Clonidine
  - Digoxin
  - Pacemaker

**Signs and Symptoms**
- Heart rate < 60 with associated hypotension, acute altered mental status, chest pain, acute CHF, seizures, syncope or shock secondary to bradycardia
- Chest pain
- Respiratory distress
- Hypotension or shock
- Altered mental status
- Syncope

**Differential**
- Acute myocardial infarction
- Hypoxia
- Pacemaker failure
- Hypothermia
- Sinus bradycardia
- Athletes
- Head injury (elevated ICP) or stroke
- Spinal cord lesion
- Sick sinus syndrome
- AV blocks (e.g. 1°, 2° or 3°)
- Overdose

---

Exit to appropriate TG

**HR < 60 and symptomatic:**
- Hypotension, acute AMS, chest pain, acute CHF, seizure, syncope, or shock secondary to bradycardia

- Cardiac monitor
- Establish IV/IO
- 12-Lead ECG
- EtCO₂ monitoring

**Atropine 0.5mg IV/IO**
- May repeat every 3 – 5 minutes as needed
- Maximum 3mg
- Should not be used in wide-complex rhythms or in 2° or 3° heart blocks

**Normal Saline bolus 500ml IV/IO**
- May repeat as needed
- Maximum 1L

**Transcutaneous pacing**
- If not responsive to Atropine. Pacing may be considered first line therapy for severe symptoms.
- Consider early in 2° or 3° blocks and patients with suspected cardiac ischemia

**Dyspnea/increased work of breathing, especially with hypoxia?**

**Notify receiving facility.**
- Contact Base Hospital for medical direction, as needed.
**Pearls**

- Bradycardia causing symptoms is typically < 50/minutes. Rhythm should be interpreted in the context of symptoms and pharmacological treatment given only when symptomatic, otherwise monitor and reassess frequently.
- Identifying signs and symptoms of poor perfusion caused by bradycardia is paramount.
- Atropine vs. pacing: Caution should be exercised in the setting of a suspected acute MI. The use of Atropine for PVCs in the presence of an acute MI may worsen heart damage. Providers should NOT DELAY transcutaneous pacing for patients with poor perfusion in the setting of an acute MI or 2° or 3° heart block.
- For patients who are not in 2° or 3° heart block, pacing may be considered for bradycardia not responsive to Atropine. Prepare to utilize transcutaneous pacing early if the patient does not respond to Atropine.
- For wide complex, bizarre appearance of QRS complexes with slow rhythm, consider hyperkalemia.
- Consider treatable causes for bradycardia (e.g. beta blocker OD, calcium channel blocker OD, etc.)
- Hypoxemia is a common cause of bradycardia. Be sure to oxygenate the patient and support respiratory effort.
- Sinus bradycardia in the absence of key symptoms requires no specific treatment; monitor and observe.
- Sinus bradycardia is often seen in patients with STEMI or ischemia. An early 12-Lead ECG should be obtained to assess for STEMI.
- A fluid bolus may address hypotension and lessen the need for pacing or treatment with Atropine.
- Sedation prior to starting pacing is not required. Patients with urgent needs should be paced first and sedated afterwards.
- The objective of sedation with pacing is to decrease discomfort, not to decrease level of consciousness. Patients who are in need of pacing are unstable and sedation should be used with extreme caution.
- Monitor respiratory status closely and support ventilation as necessary.
- Atropine is not effective for bradycardia in heart transplant patients as there is no vagus nerve innervation in these patients.
- Patients with wide QRS or 2° or 3° heart blocks will not have a response to Atropine because they heart rates are not based on vagal tone. An increase in ventricular arrhythmias may occur.
Contra Costa County Emergency Medical Services

Narrow Complex Tachycardia

History
- Medications (e.g. Aminophylline, Adderall, diet pills, thyroid supplements, decongestants, and Digoxin)
- Diet
- Drugs (e.g. nicotine and illegal drugs)
- Past medical history
- History of palpations/heart racing
- Syncope/near syncope

Signs and Symptoms
- Heart rate > 150 with narrow, regular complexes
- Systolic BP < 90
- Dizziness, chest pain, shortness of breath, altered mental status, or diaphoresis
- CHF
- Potential presenting rhythm:
  - Atrial/sinus tachycardia
  - Atrial fibrillation/flutter
  - Multifocal atrial tachycardia
  - Ventricular tachycardia

Differential
- Heart disease (e.g. WPW or valvular)
- Sick sinus syndrome
- Myocardial infarction
- Electrolyte imbalance
- Exertion, pain, or emotional stress
- Fever
- Hypoxia
- Hypovolemia or anemia
- Drug effect/overdose (see History)
- Hypothyroidism
- Pulmonary embolus

Assess symptom severity

Unstable
(HR typically > 150)

Cardiac monitor

Consider sedation pre-cardioversion
Midazolam 1mg IV/IO
May repeat if needed in 1-2mg increments
Maximum 5mg

EtCO₂ monitoring

Establish IV/IO

Regular rhythm (SVT)
(QRS ≤ 0.09 sec)

Synchronized cardioversion 100J
May repeat in escalating energy (200J, 300J, 360J)
12-Lead ECG or repeat if rhythm change

Irregular rhythm
(A-Fib/A-Flutter)

Synchronized cardioversion 200J
May repeat in escalating energy (300J, 360J)
12-Lead ECG or repeat if rhythm change

Stable

Cardiac monitor

Consider IV/IO

12-Lead ECG

EtCO₂ monitoring

Attempt Valsalva maneuver

Regular rhythm (SVT)
(QRS ≤ 0.09 sec)

Irregular rhythm
(A-Fib/A-Flutter)

Adenosine 6mg IV/IO rapid push
May repeat 12mg IV/IO
If rhythm change, repeat 12-Lead ECG

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.

Effective Jan. 2020
Pearls

- Most important goal is to differentiate the type of tachycardia and if STABLE or UNSTABLE.
- If at any point the patient becomes unstable, move to the unstable arm of the algorithm.
- For ASYMPTOMATIC patients (or those with only minimal symptoms, such as palpitations) and any tachycardia with a rate of approximately 100 – 120 with a normal blood pressure, consider CLOSE OBSERVATION or fluid bolus rather than immediate treatment with an anti-arrhythmic medication. For example, a patient’s “usual” atrial fibrillation may not require emergent treatment.
- All Adenosine administrations should be immediately followed by a 20ml rapid flush.
- Typical sinus tachycardia is in the range of 100 to (200 – the patient’s age) beats per minute.
- Symptomatic tachycardia usually occurs at rates of 120 – 150 and typically ≥ 150 beats per minute. Patients who are symptomatic with heart rates < 150 likely have impaired cardiac function, such as CHF.
- Serious Signs / Symptoms include: Hypotension; acutely altered mental status; signs of shock/poor perfusion; chest pain with evidence of ischemia (e.g. STEMI, T-wave inversions or depressions); and acute CHF.
- Search for underlying cause of tachycardia such as fever, sepsis, dyspnea, etc.
- If patient has a history or if 12-Lead ECG reveals Wolfe Parkinson White (WPW), use caution with Adenosine and give only with a defibrillator immediately available.
- Regular Narrow-Complex Tachycardias:
  - Adenosine may be considered to assist with rhythm diagnosis or if a patient has a history of Adenosine conversion.
  - Adenosine may not be effective with atrial fibrillation/flutter, yet is not harmful and may help identify rhythm.
- Synchronized Cardioversion is recommended to treat UNSTABLE atrial fibrillation/flutter and monomorphic-regular tachycardia (SVT).
- Monitor for respiratory depression and hypotension associated with Midazolam.
- Continue pulse oximetry and EtCO₂ monitoring is required for all narrow complex tachycardia patients.
- Providers must export all monitor data to EHR when caring for and treating narrow complex tachycardia patients.
Wide Complex Tachycardia

**History**
- Medications (e.g. Aminophylline, Adderall, diet pills, thyroid supplements, decongestants, and Digoxin)
- Diet (e.g. caffeine and chocolate)
- Drugs (e.g. nicotine and illegal drugs)
- Past medical history
- History of palpitations/heart racing
- Syncope/near syncope
- Renal failure
- Missed dialysis

**Signs and Symptoms**
- Heart rate > 150
- Systolic BP < 90
- Dizziness, chest pain, shortness of breath, altered mental status or diaphoresis
- CHF
- Potential presenting rhythm:
  - Atrial/sinus tachycardia
  - Atrial fibrillation/flutter
  - Multifocal atrial tachycardia
  - Ventricular tachycardia

**Differential**
- Heart disease (e.g. WPW or valvular)
- Sick sinus syndrome
- Myocardial infarction
- Electrolyte imbalance
- Exertion, pain, or emotional stress
- Fever
- Hypoxia
- Hypovolemia or anemia
- Drug effect/overdose (see History)
- Hypothyroidism
- Pulmonary embolus

---

**Assess symptom severity**

**Unstable** (HR typically > 150)
- Cardiac monitor
- Consider sedation pre-cardioversion
  - Midazolam 1mg IV/IO
  - May repeat if needed in 1-2mg increments
  - Maximum 5mg
- EtCO₂ monitoring
- Establish IV/IO
- Synchronized cardioversion 360J
  - If any delay in synchronized cardioversion and the patient is critical, defibrillate 360J
  - Contact Base Hospital for further direction if recurrent or resistant to initial three (3) shocks
  - 12-Lead ECG
  - or repeat if rhythm change

**Stable**
- Cardiac monitor
- Establish IV/IO
- 12-Lead ECG
- EtCO₂ monitoring
- if symptomatic, consider
  - Amiodarone 150mg IV/IO drip over 10 minutes
  - May repeat x 1 dose if needed
  - If rhythm change, repeat 12-Lead ECG

**Notify receiving facility.**
- Contact Base Hospital for medical direction, as needed.
Wide Complex Tachycardia

Torsades de pointes or torsade de pointe (TdP or simply torsade(s)) is a specific type of polymorphic ventricular tachycardia that exhibits distinct characteristics on the electrocardiogram (ECG). If this does not occur, possible adverse outcomes include palpitations, dizziness, lightheadedness (during shorter episodes), fainting (during longer episodes), and sudden cardiac death.

Pearls
- Most important goal is to differentiate the type of tachycardia and if STABLE or UNSTABLE.
- If at any point the patient becomes unstable, move to the unstable arm of the algorithm.
- For ASYMPOTOMATIC patients (or those with only minimal symptoms, such as palpitations) and any tachycardia with a rate of approximately 100 – 120 with a normal blood pressure, consider CLOSE OBSERVATION or fluid bolus rather than immediate treatment with an anti-arrhythmic medication. For example, a patient’s “usual” atrial fibrillation may not require emergent treatment.
- In unstable patients with fever or other signs of sepsis, the underlying cause of the rapid heart rate is more likely fever and hypovolemia. This is particularly true in wide irregular tachycardia which is frequently underlying A fib with a bundle branch block. Initial efforts should focus on treating appropriately for underlying sepsis.
- In Polymorphic VT: (torsade de pointes) etc., the variation in QRS morphology may make it difficult to synchronize. If you cannot synchronize, move to defibrillation.
- In wide irregular rhythm such as A Fib with left or right bundle etc, synchronized cardioversion at 360J is more likely to yield first shock conversion.
- Typical sinus tachycardia is in the range of 100 to (200 – the patient’s age) beats per minute.
- Symptomatic tachycardia usually occurs at rates of 120 – 150 and typically ≥ 150 beats per minute. Patients who are symptomatic with heart rates < 150 likely have impaired cardiac function, such as CHF.
- Serious Signs/Symptoms include: Hypotension; acutely altered mental status; signs of shock/poor perfusion; chest pain with evidence of ischemia (e.g. STEMI, T-wave inversions, or depressions); and acute CHF.
- Search for underlying cause of tachycardia such as fever, sepsis, dyspnea, etc.
- Monitor for respiratory depression and hypotension associated with Midazolam.
- Continue pulse oximetry and EtCO₂ monitoring is required for all wide complex tachycardia patients.
- Providers must export all monitor data to EHR when caring for and treating wide complex tachycardia patients.
Contra Costa County Emergency Medical Services

Chest Pain: Suspected Cardiac or STEMI

History
- Age
- Medications (e.g. Viagra, Sildenafil, Levitra, Vardenafil, Cialis or Tadalafil)
- Past medical history (e.g. MI, angina, diabetes, or post menopausal)
- Allergies
- Recent physical exertion
- Provocation
- Quality (e.g. pressure, constant, sharp, dull, etc.)
- Region/Radiation/Referred
- Severity (0 – 10 scale)
- Time (onset/duration/repetition)

Signs and Symptoms
- Heart rate < 60 with associated hypotension, acute altered mental status, chest pain, acute CHF, seizures, syncope, or shock secondary to bradycardia
- Chest pain
- Respiratory distress
- Hypotension or shock
- Altered mental status
- Syncope

Differential
- Acute myocardial infarction
- Hypoxia
- Pacemaker failure
- Hypothermia
- Sinus bradycardia
- Athletes
- Head injury (elevated ICP) or stroke
- Spinal cord lesion
- Sick sinus syndrome
- AV blocks (e.g. 1st, 2nd, or 3rd)
- Overdose

Signs and Symptoms
- Heart rate < 60 with associated hypotension, acute altered mental status, chest pain, acute CHF, seizures, syncope, or shock secondary to bradycardia
- Chest pain
- Respiratory distress
- Hypotension or shock
- Altered mental status
- Syncope

Acute MI/STEMI
- STEMI = 1mm ST segment elevation ≥ 2 contiguous leads; See 12-Lead Procedure

Establish IV/IO
- Nitroglycerin 0.4mg sublingual if systolic BP is > 90
- May repeat every 5 minutes until pain subsides.
- Max 3 doses
- Consider Fentanyl 25 – 200mcg IV titrated in 25 – 50mcg increments for pain relief if BP > 90 systolic
- If indicated, Normal Saline bolus 500ml IV/IO
- May repeat as needed
- Maximum 1L

Declare a STEMI Alert
- Establish IV/IO
- Consider Fentanyl 25 – 200mcg IV titrated in 25 – 50mcg increments for pain relief if BP > 90 systolic
- If indicated, Normal Saline bolus 500ml IV/IO
- May repeat as needed
- Maximum 1L

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.

Approved STEMI Receiving Centers
- John Muir – Concord
- John Muir – Walnut Creek
- Kaiser – Walnut Creek
- San Ramon Regional
- Sutter Delta
- Highland – Oakland
- Kaiser – Vallejo
- Marin General
- Summit – Oakland
- Kaiser – Oakland
- Valley Care – Pleasanton

**Pearls**

- Avoid Nitroglycerin in any patient who has used Viagra (Sildenafil) or Levitra (Vardenafil) in the past 24 hours or Cialis (Tadalafil) in the past 36 hours due to the potential of severe hypotension.
- Patients with a STEMI should be transported to the closest most appropriate STEMI receiving center.
- Many STEMs evolve during prehospital care and may not be noted on the initial 12-Lead ECG.
- An ECG should be obtained prior to treatment for bradycardia if patient condition permits.
- Transmit all 12-Lead ECGs whether STEMI is detected or not.
- If a patient has taken their own Nitroglycerin without relief, consider potency of medication. Provider maximum doses do not include patient administered doses.
- Monitor for hypotension after administration of nitroglycerin and opioids.
- Diabetics, geriatric, and female patients often have atypical pain, or only generalized complaints. Suspect cardiac etiology in these patients, and perform a 12-Lead ECG.
- Document the time of the 12-Lead ECG in the EHR as a procedure along with the interpretation.
History
- Age
- Past medical/surgical history
- Medications
- Onset
- Provocation
- Quality (e.g. crampy, constant, sharp, dull, etc.)
- Region / radiation/referred
- Severity (0 – 10 scale)
- Time (duration/repetition)
- Fever
- Last meal eaten
- Last bowel movement/emesis
- Menstrual history (pregnancy)

Signs and Symptoms
- Pain (location/migration)
- Tenderness
- Nausea
- Vomiting
- Diarrhea
- Dysuria (painful or difficult urination)
- Constipation
- Vaginal bleeding/discharge
- Pregnancy

Associated symptoms: (Helpful to localize source)
Fever, headache, weakness, malaise, myalgia, cough, headache, mental status change, or rash

Differential
- Pneumonia or pulmonary embolus
- Liver (hepatitis)
- Peptic ulcer disease/gastritis
- Gallbladder
- MI
- Pancreatitis
- Kidney stone
- Abdominal aneurysm
- Appendicitis
- Bladder/prostate disorder
- Pelvic (PID, ectopic pregnancy, or ovarian cyst)
- Spleen enlargement
- Diverticulitis
- Bowel obstruction
- Gastroenteritis (infectious)
- Ovarian or testicular torsion

CONTRA COSTA
EMERGENCY MEDICAL SERVICES

Abdominal Pain

Assess symptom severity

Signs/symptoms suggesting cardiac
Etiology?

Exit to Appropriate Cardiac TG

Unstable
(Hypotension/poor perfusion)

Establish IV/IO

Normal Saline bolus 500ml
Repeat as needed
Titrated to systolic BP > 90
Maximum 1L

Cardiac monitor

Consider 12-Lead ECG

Stable

Establish IV/IO

Cardiac monitor

P

If patient has nausea or vomiting
Ondansetron 4mg
IV/IO/IM/ODT
May repeat x 1 after 15 minutes

Exit to Pain Control TG
if indicated

Hypotensive, Signs and
Symptoms of shock?
Yes

Exit to Hypotension/Shock TG
if indicated

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.
Pearls

- Diabetic, females, and geriatric patients often have atypical pain, or only generalized complaints. Suspect cardiac etiology in these patients, perform a 12-Lead ECG, and investigate until proven otherwise.
- For chronic abdominal pain, consider non-narcotic pain control.
- Zofran is not indicated or useful for motion sickness.
- Document the mental status and vital signs prior to administration of anti-emetics.
- Abdominal pain in women of childbearing age should be treated as pregnancy-related until proven otherwise.
- An impression of abdominal aneurysm should be considered with severe abdominal or non-traumatic back pain, especially in patients > 50 years of age or patients with shock/poor perfusion.
**Adult Airway**

**Assess respiratory rate, effort, oxygenation**
- Is airway/breathing adequate?
  - Yes: Goal oxygen saturation ≥ 94%
  - Exit to appropriate TG

**Basic maneuvers first**
- Open airway chin lift/jaw thrust
- Nasal or oral airway
- Bag-valve mask (BVM)

**Spinal motion restriction**
- if indicated

**Airway patent?**
  - Yes: Supplemental oxygen via BVM
  - No: Complete obstruction?

**Complete obstruction?**
- Yes: Abdominal thrusts (conscious)
  - Monitor/reassess supplemental oxygen if indicated
  - Exit to appropriate TG
- No: Chest compression (unconscious)

**Breathing/oxygenation support required?**
  - Yes: Supplemental oxygen via BVM
  - No: Direct laryngoscopy

**Direct laryngoscopy**
- I-Gel, as indicated in cardiac arrest
- I-Gel or intubation, as indicated

**Consider, sedation if I-Gel or ETT in place**
- Midazolam IV/IO
  - Maximum 5 mg total

**Reassess airway procedure and adjust if necessary**
- Yes: BVM effective?
  - Yes: Notify receiving facility.
  - Contact Base Hospital for medical direction, as needed.
Always weigh the risks and benefits of endotracheal intubation in the field against transport. All prehospital endotracheal intubations are considered high risk. If ventilation/oxygenation is adequate, transport may be the best and safest option. The most important airway device is the BVM, not the laryngoscope.

Cormack-Lehane Difficult Airway Assessment:

<table>
<thead>
<tr>
<th>Grade I</th>
<th>Grade II</th>
<th>Grade III</th>
<th>Grade IV</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete view of glottic opening and surrounding structures</td>
<td>Partial view of the glottic opening</td>
<td>Only the epiglottis is visible</td>
<td>No distinguishable anatomy is visible</td>
</tr>
</tbody>
</table>

**Trauma:** Utilize in-line cervical stabilization during intubation, BLS airway or BVM use. During intubation, the cervical collar front should be open or removed to facilitate translation of the mandible/mouth opening.

**Pearls**
- Continuous capnometry (EtCO₂) is mandatory with all methods of airway management. Document results.
- If an effective airway is being maintained with a BVM and a basic airway adjunct with continuous pulse oximetry values of ≥ 90% or values expected based on pathophysiologic condition with otherwise reassuring vital sign (e.g. pulse oximetry of 85% with otherwise normal vital signs in a post-drowning patient), it is acceptable to continue with basic airway measures rather than placing an advanced airway.
- For the purposes of this TG, a secure airway is achieved when the patient is receiving appropriate oxygenation and ventilation.
- An intubation attempt is defined as inserting the laryngoscope blade with the intent to intubate or inserting an advanced airway past the teeth.
- An appropriate ventilatory rate is one that maintains an EtCO₂ of 35 or greater. Avoid hyperventilation.
- A Bougie is strongly encouraged for all ET intubation attempts.
- Effective use of a BVM is best achieved with two (2) people.
- The airway should be reassessed with each patient move. Document findings and EtCO₂ readings for each.
- Maintain spinal motion restriction for patients with suspected spinal injury.
- Document visualization and grading scale in prehospital record.
- Hyperventilation in deteriorating head trauma should only be done to maintain an EtCO₂ of 30-35.
- It is important to secure the advanced airway well and consider c-collar use (in the absence of trauma) to better maintain advanced airway placement. Manual stabilization of advanced airway should be used during all patient moves/transfers.
Contra Costa County Emergency Medical Services

Adult Behavioral

History
- Situational crisis
- Psychiatric illness/medications
- Injury to self or threats to others
- Medical alert tag
- Substance abuse/overdose
- Diabetes

Signs and Symptoms
- Anxiety, agitation or confusion
- Affect change or hallucinations
- Delusional thoughts or bizarre behavior
- Combative or violent
- Expression of suicidal/homicidal thoughts

Differential
- Altered mental status
- Alcohol intoxication
- Toxin / substance abuse
- Medication effect/overdose
- Withdrawal symptoms
- Depression
- Bipolar (manic-depressive)
- Schizophrenia
- Anxiety disorders
- Hypoglycemia

- Aggressive or agitated, possible psychosis, possible danger to self, or others
  - Midazolam 5mg IM/IN or Midazolam 1-3mg IV in 1mg increments
    Age ≥ 65 years of age 1mg IV/IM
    May repeat every 5 minutes to effect.
    Maximum 5mg

  - Consider restraints
  - Monitor restraints and PMS if indicated
  - Consider external cooling measures
  - Monitor and reassess
  - Blood glucose analysis
  - Consider IV
  - Cardiac monitor

  - Excited Delirium Syndrome
    Paranoia, disorientation, extremely aggressive or violent, hallucinations, tachycardia, increased strength, hyperthermia, and clearly a danger to self or others
    Midazolam 5mg IM/IN
    May repeat 2.5mg every 5 minutes to effect.
    Maximum 10mg

  - Exit to appropriate TG, if indicated
    Altered Mental Status TG
    Overdose/Toxic Ingestion TG
    Head Trauma TG
    Assume patient has medical cause of behavioral change

  - Notify receiving facility.
    Contact Base Hospital for medical direction, as needed.

  - Midazolam
    Contact Base Hospital Physician for additional order

Excited Delirium Syndrome:

This is a medical emergency. The condition is a combination of delirium, psychomotor agitation, anxiety, hallucinations, speech disturbances, disorientation, violent/bizarre behavior, insensitivity to pain, hyperthermia and increased strength. The condition is life-threatening and is often associated with use of physical control measures, including physical restraints, and tasers. Most commonly seen in male patients with a history of serious mental illness or drug abuse, particularly stimulant drugs such as cocaine, crack cocaine, methamphetamine, amphetamines, bath salts, or similar agents. Alcohol withdrawal or head injury may also contribute to the condition.

Pearls

- Crew/responder safety is the main priority. See Policy 1008 – Managing Assaultive Behavior/Patient Restraint.
- Avoid using benzodiazepines for patients with alcohol intoxication.
- Limit IN administrations to ½ dose in each nare.
- All patients who receive either physical restraint or chemical sedation must be continuously observed by EMS personnel. This includes direct visualization of the patient as well as cardiac and pulse oximetry monitoring.
- Consider all possible medical/trauma causes for behavior (e.g. hypoglycemia, overdose, substance abuse, hypoxia, seizure, head injury, etc.).
- Use caution when considering the use of Midazolam with postictal patients.
- Do not irritate the patient with a prolonged exam. Be thorough but quick.
- Do not overlook the possibility of associated domestic violence or child abuse.
- If patient suspected of excited delirium and suffers cardiac arrest, consider fluid bolus and sodium bicarbonate early.
- Do not position or transport any restrained patient in a way that negatively affects the patient’s respiratory or circulatory status (e.g. hog-tied or prone positions). Do not place backboards, splints or other devices on top of the patient.
- If restrained, the extremities that are restrained will have a circulation check at least every 15 minutes. The first of these checks should occur as soon after placement of the restraints as possible. This shall be documented in the EHR.
Contra Costa County Emergency Medical Services

Allergic Reaction/Anaphylaxis

### History
- Onset and location
- Insect sting or bite
- Food allergy / exposure
- Medication allergy / exposure
- New clothing, soap or detergent
- Past history of reactions
- Past medical history
- Medication history

### Signs and Symptoms
- Itching or hives
- Coughing, wheezing or respiratory distress
- Chest or throat restriction
- Difficulty swallowing
- Hypotension or shock
- Edema
- Nausea or vomiting
- Feeling of impending doom

### Differential
- Urticaria (rash only)
- Anaphylaxis (systemic effect)
- Shock (vascular effect)
- Angioedema (drug induced)
- Aspiration or airway obstruction
- Vasovagal event
- Asthma or COPD
- CHF

### Procedure

#### Systemic
- Assess symptom severity
- Establish IV/IO
- Cardiac monitor

#### Localized
- Establish IV/IO
- Cardiac monitor
- Consider, Diphenhydramine 50mg IV/IO/IM
- Monitor and reassess
- Monitor for worsening signs and symptoms

### Airway Procedure

- Consider, Albuterol nebulizer 5mg
- Repeat as needed if indicated
- Normal Saline bolus 500ml IV/IO
- Repeat as needed to Max of 1L
- Airway Procedure if indicated

### Epinephrine
- Assist patient with self-prescribed Epinephrine Auto-Injector if available
- Administer Epinephrine Auto-Injector
- Use Pediatric Epinephrine Auto-Injector for patients >50 years of age
- Epinephrine 1:1,000 0.3mg IM (Use 0.15mg for patients >50 years of age)
- Establish IV/IO
- Cardiac monitor
- EtCO₂ monitoring
- Consider, Diphenhydramine 50mg IV/IO/IM

### Situation
- Notify receiving facility.
- Contact Base Hospital for medical direction, as needed.

### Effective
Jan. 2020

---

Treatment Guideline A04
Page 1 of 2
Pearls

- Anaphylaxis is an acute and potentially lethal multisystem allergic reaction.
- Epinephrine is the drug of choice and the first drug that should be administered in acute anaphylactic reactions with moderate or severe symptoms. IM Epinephrine should be administered as priority before or during attempts at IV or IO access.
- Anaphylaxis that is unresponsive to initial treatment of IM Epinephrine may require IV Epinephrine administration.
- Allergic reactions may occur with only respiratory and gastrointestinal symptoms and have no rash or skin involvement.
- Angioedema is seen in moderate to severe reactions and is swelling involving the face, lips, or airway structures. This can also be seen in patients taking ACE-inhibitor blood pressure medications such as Prinivil, Zesteril, or Lisinopril; medications typically ending in -il.
- Epinephrine may precipitate cardiac ischemia. The following patients should receive half the adult dose of Epinephrine (0.15mg Epinephrine 1:1,000) for the initial dose and any repeated doses:
  - Patients with a history of coronary artery disease, MI, stents, CHF, cardiac surgery; OR
  - Patients over 50 years of age.
  - EMTs use an EpiPen Junior.
- Adult patient who receive Epinephrine should receive a 12-Lead ECG at some point during their care, but this should NOT delay the administration of Epinephrine.
- All patients with respiratory symptoms must have continuous pulse oximetry and EtCO₂ measurement.
- The shorter the onset of symptoms from contact with an allergen, generally the more severe the reaction.
Contra Costa County Emergency Medical Services

Altered Mental Status

**History**
- Known diabetic or medical alert tag
- Drugs or drug paraphernalia
- Report of illicit drug use or toxic ingestion
- Past medical history
- Medications
- History of trauma or traumatic brain injury
- Change in condition
- Changes in feeding or sleep habits

**Signs and Symptoms**
- Change in baseline mental status
- Decrease mental status or lethargy
- Bizarre behavior
- Hypoglycemia (cool, diaphoretic skin)
- Hyperglycemia (warm, dry skin; fruity breath; Kussmaul respirations; signs of dehydration)
- Irritability

**Differential**
- Head trauma
- CNS (stroke, tumor, seizure, infection)
- Cardiac (MI, CHF)
- Hypothermia
- Infection or sepsis
- Thyroid
- Shock
- Diabetes
- Toxicological or ingestion
- Acidosis or alkalosis
- Environmental exposure
- Hypoxia
- Electrolyte abnormality
- Psychiatric disorder
- Sepsis

---

**Flowchart**

- **Airway TG, if indicated**
- Blood glucose analysis
- Cardiac monitor
- 12-Lead ECG
- IV/IO Procedure

**Blood glucose ≤ 60 or ≥ 350**
- **Yes**
  - Exit to Diabetic TG

**Signs of shock/poor perfusion**
- **Yes**
  - Exit to Hypotension/Shock TG

**Signs of OD/toxic exposure**
- **Yes**
  - Exit to Overdose/Toxic Exposure TG

**Signs of stroke or seizure**
- **Yes**
  - Exit to Stroke or Seizure TG as indicated

**Signs of hypo/hyperthermia**
- **Yes**
  - Exit to Hypo / Hyperthermia TG as indicated

**Arrhythmia/STEMI**
- **Yes**
  - Exit to Appropriate Cardiac TG as indicated

**Signs of sepsis**
- **Yes**
  - Exit to Suspected Sepsis TG as indicated

---

**Notify receiving facility. Contact Base Hospital for medical direction, as needed.**
Pearls

- Pay careful attention to the head exam for signs of bruising or other injury.
- Be aware of AMS as a presenting sign of an environmental toxin or Haz-mat exposure and protect personal safety and that of other responders who may already be exposed.
- It is safer to assume hypoglycemia than hyperglycemia if doubt exists. Recheck blood glucose after D-10 or Glucagon administration.
- Do not let alcohol confuse the clinical picture. Alcoholics frequently develop hypoglycemia and may have unrecognized injuries.
- Consider restraints if necessary for patient or personnel protection.
**Contra Costa County Emergency Medical Services**

**Childbirth/Labor Treatment Guideline A06**

**History**
- Due date
- Time contractions started/how often
- Rupture of membranes
- Time/amount of any vaginal bleeding
- Sensation of fetal activity
- Past medical and delivery history
- Medications
- Gravida/Para status
- High risk pregnancy

**Signs and Symptoms**
- Spasmodic pain
- Vaginal discharge or bleeding
- Crowning or urge to push
- Meconium

**Differential**
- Abnormal presentation
  - Buttock
  - Foot
  - Hand
- Prolapsed cord
- Placenta previa
- Abruptio placenta

**Flowchart**
- Place patient in left lateral recumbent position
- Note any abnormal vaginal bleeding, hypertension or hypotension
- Inspect perineum (No digital vaginal exam)
- Monitor and reassess
  - Document frequency and duration of contractions
- Childbirth procedure
  - Establish IV/IO
  - Prolapsed cord
    - Shoulder dystocia
      - Hips elevated
      - Knees to chest
      - Insert fingers into vagina to relieve pressure on cord
      - Saline dressing over cord
      - Transport unless delivery imminent
      - Encourage mother to refrain from pushing
      - Support presenting part(s) DO NOT PULL
  - Breach birth
    - Transport in knee-to-chest position or left lateral position
- Notify receiving facility.
  - Contact Base Hospital for medical direction, as needed.

**Priority symptoms:**
- Crowning at < 36 weeks gestation
- Abnormal presentation
- Severe vaginal bleeding
- Multiple gestation

**Unable to deliver**
- Create air passage by supporting presenting part of the infant
- Place 2 fingers along side of the nose and push away from face
- Transport in knee-to-chest position or left lateral position

**Delivered Baby**
- Exit to Newly Born TG
Pearls

- Document all times (delivery, contraction frequency and length, and time cord was cut).
- Document the name of the prehospital provider who cut the cord.
- After delivery, massaging the uterus (lower abdomen) will promote uterine contraction and help to control postpartum bleeding.
- Some perineal bleeding is normal with any childbirth. Large quantities of blood or free bleeding are abnormal.
Diabetic

History
- Past medical history
- Medications
- Recent blood glucose check
- Last meal

Signs and Symptoms
- Altered mental status
- Combatting or irritable
- Diaphoresis
- Seizure
- Abdominal pain
- Nausea or vomiting
- Weakness
- Dehydration
- Deep or rapid breathing

Differential
- Alcohol or drug use
- Toxic ingestion
- Trauma or head injury
- Seizure
- Stroke
- Altered baseline mental status

Altered Mental Status TG

If indicated

Blood glucose ≤ 60mg/dl

Able to follow commands but symptomatic

Yes

Consider Oral Glucose 30g

No

D-10 100ml IV

No venous access
Glucagon 1mg IM
Repeat in 15 minutes if needed

Consider IO access as a last resort

Improving?

Yes

Return to baseline mental status?

No

P

If blood glucose ≤ 60mg/dl
D-10 150ml IV

Improving?

Yes

No

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.

Blood glucose ≥ 350mg/dl

Suspected hypoglycemia or patient’s glucometer results read <60mg/dl

Blood glucose analysis

Cardiac monitor

12-Lead ECG procedure if indicated

Establish IV/IO

If no evidence of CHF/fluid overload
Normal Saline bolus 500ml IV

Hypotension?

Yes

Exit to Hypotension/ Shock TG

No

P

Yes

Hypotension?

No

IF adult present AND blood glucose > 100mg/dl AND patient eats meal now AND is complaint free, THEN transport need not be recommended

Recommend transport or conduct Refusal if indicated

IF adult present AND blood glucose > 100mg/dl AND patient eats meal now AND is complaint free, THEN transport need not be recommended

D-10 Base Hospital for additional order

N
Pearls

• It is safer to assume hypoglycemia than hyperglycemia if doubt exists.
• Recheck BGL after each D-10 or Glucagon administration.
• Patients with prolonged hypoglycemia may not respond to Glucagon.
• Response to Glucagon can take 15-20 minutes. Consider the entire clinical picture when treating hypoglycemia, including a patient’s overall clinical condition and other vital signs. It may be safe to wait for some time for Glucagon to work instead of pursuing the more aggressive course of performing IO access to give faster acting D-10 solution. Diabetics may have poor wound healing capabilities, and IO access may present a greater risk for infection or complicate the patient’s long-term condition due to poor wound healing. IO access may also present a greater risk for infection. On the other hand, consider IO access to give D-10 solution early in patients who are critically ill or peri-arrest and hypoglycemic.
• Do not administer oral glucose to patients that are not able to swallow or protect their airway.
• Quality control checks should be maintained per manufacturer’s recommendation for all glucometers.
• Patients refusing transport to a hospital after treatment of hypoglycemia:
  - **Oral agents**: Patients taking oral diabetic medications should be strongly encouraged to allow ambulance transportation to a hospital. They are at risk of recurrent hypoglycemia that can be delayed for hours and require close monitoring even after a prehospital blood glucose level of greater than 60mg/dl has been achieved. Patients who meet criteria to refuse care should be instructed to contact their physician immediately and consume a meal with complex carbohydrates and protein now.
  - **Insulin agents**: Many forms of Insulin now exist. Longer acting Insulin places the patient at risk of recurrent hypoglycemia even after a prehospital blood glucose level of greater than 60mg/dl has been achieved. Patient who meet criteria to refuse care should be instructed to contact their physician immediately and consume a meal with complex carbohydrates and protein now.
**History**
- Peritoneal or hemodialysis
- Anemia
- Catheter access noted
- Shunt access noted
- Hyperkalemia

**Signs and Symptoms**
- Hypotension
- Bleeding
- Fever
- Electrolyte imbalance
- Nausea or vomiting
- Altered mental status
- Seizure
- Cardiac arrhythmia

**Differential**
- Congestive heart failure
- Pericarditis
- Diabetic emergency
- Sepsis
- Cardiac tamponade

---

**Flowchart**

1. Graft or fistula bleeding?  
   - No
   - CHF or pulmonary edema?  
     - Yes  
       - Exit to CHF/Pulmonary Edema TG  
     - No  
       - Cardiac arrest?  
         - Yes  
           - Establish IV/IO
           - Calcium Chloride 1g IV/IO
           - 20ml flush IV/IO prior to administering next med
           - Sodium Bicarbonate 50mEq IV/IO
           - Exit to appropriate TG
         - No  
1. Blood glucose analysis
   - 12-Lead ECG
   - Establish IV/IO
   - Cardiac monitor
   - Blood glucose ≤ 60 or ≥ 350mg/dl?
     - Yes  
       - Peaked T-wave and wide QRS? (QRS ≥ 0.12 sec)  
         - Yes  
           - Notify receiving facility.
           - Contact Base Hospital for medical direction, as needed.
         - No  
       - Exit to Diabetic TG
     - No  
       - Exit to Hypotension TG
Peaked T-waves are a sign of hyperkalemia. Increased extracellular potassium reduces myocardial excitability, which results in the depression of both pace making and conducting tissues. Progressively worsening hyperkalemia leads to suppression of impulse generation by the SA node and reduced conduction by the AV node and HIS-Purkinje system, resulting in bradycardia and conduction blocks that ultimately lead to cardiac arrest.

In order to treat hyperkalemia in the prehospital setting, the QRS must be ≥ 0.12 seconds. If the patient has not yet arrested, be prepared for the patient to do so. Early recognition and treatment is essential to helping reverse this critical condition.

Pearls

- Do not take blood pressure or start IV in extremity which has a fistula/graft in place.
- For dialysis patients whose peripheral access site (fistula/graft) has already been accessed, the existing IV line may be used by a paramedic for administration of fluids or medications.
- Paramedics may access a dialysis fistula/graft if the patient is in cardiac arrest and attempts at IV and IO access have failed.
- If local pressure does not control significant hemorrhage from dialysis fistula or graft, utilize a tourniquet to stop bleeding. Apply the tourniquet as far away from the fistula/graft as possible.
- Always consider hyperkalemia in all dialysis or renal failure patients.
- Sodium Bicarbonate and Calcium Chloride should not be mixed. Ideally, administer in separate lines.
- Renal failure and dialysis patients generally have numerous medical problems. Hypertension and cardiac disease are prevalent.
History
- Asthma; COPD – chronic bronchitis and emphysema
- Home treatment (e.g. oxygen or nebulizer)
- Medications (e.g. Theophylline, steroids, inhalers, digoxin, lasix, Viagra, Sildenafil, levitra, vardenafil, cialis, or tadalafil)
- Toxic exposure or smoke inhalation
- Cardiac History including MI

Signs and Symptoms
- Shortness of breath
- Increased respiratory rate and effort
- Diminished or abnormal lung sounds
- Tachycardia
- Purse lip breathing
- Use of accessory muscles
- Peripheral edema or diaphoresis
- Pink, frothy sputum

Differential
- Asthma
- COPD
- Congestive Heart Failure
- Myocardial Infarction
- Aspiration
- Pneumonia
- Pulmonary embolus
- Hyperventilation
- Inhaled toxin

Airway Obstructed?
- Yes: Exit to A02 - Adult Airway TG
- No

Allergic Reaction/Anaphylaxis?
- Yes: Exit to A04 – Allergic Reaction/Anaphylaxis TG
- No

Ventilation Adequate? Oxygenation Adequate?
- Yes
- No

Lung Sounds
- Wheezes, Hx of Asthma/COPD
- Rales, pedal edema, hx of heart disease

PERI-ARREST OR SEVERE DISTRESS?
- Consider administering Epinephrine 1:1,000 0.3mg IM

Albuterol nebulizer 5mg
- Repeat as needed
- Consider CPAP

Improving?
- Yes
- No

If no improvement, consider Epinephrine 1:1,000 0.3mg IM (Use 0.15mg for patients > 50 years of age)

Notify receiving facility. Contact Base Hospital for medical direction, as needed

Nitroglycerin 0.4mg sublingual
- If systolic BP > 150, double Nitroglycerin to 0.8mg sublingual
- Repeat every 5 minutes as needed

Nitotensive Systolic < 90
- Remove CPAP
- Consider A12 Hypotension/Shock TG

BP > 90
- Consider CPAP

Improving?
Pearls

- If a patient is in CHF AND the 12 lead indicates STEMI, treat with nitroglycerine as on this treatment guideline. Nitro is withheld if the patient has a STEMI and CHF symptoms are not present.
- Patients receiving epinephrine should receive a 12-Lead ECG at some point in their care in the prehospital setting, but this should NOT delay the administration of Epinephrine.
- Epinephrine may precipitate cardiac ischemia. The following patients should receive half the adult dose of Epinephrine (0.15mg Epinephrine 1:1,000) for the initial dose and any repeated doses:
  1) Patients with a history of coronary artery disease, MI, stents, CHF, cardiac surgery; OR
  2) Patients over 50 years of age and has a heart rate ≥ 150.
- Pulse oximetry and continuous EtCO₂ monitoring is required for all respiratory patients.
- A silent chest in respiratory distress is a pre-respiratory arrest sign.
- CPAP is not a ventilation device. Patients with an inadequate respiratory rate or depth of respiration will need assistance with a BVM.
- Opioids have NOT been shown to improve the outcomes of EMS patients with pulmonary edema. Even though this has historically been a mainstay of EMS treatment, it is no longer routinely recommended.
- Avoid Nitroglycerin in any patient who has used Viagra (Sildenafil) or Levitra (Vardenafil) in the past 24 hours or Cialis (Tadalafil) in the past 36 hours due to potential for severe hypotension.
- Carefully monitor the patient’s level of consciousness, chest pain, and respiratory status with the above interventions.
- If a patient has taken their own nitroglycerin without relief, consider potency of medication. Provider maximum doses do not include patient administered doses.
- Consider MI in all of these patients: Diabetic, geriatric, and female patients often have atypical pain or only generalized complaints.
- Document CPAP application using the CPAP procedure in the EHR. Document the 12-Lead ECG in the EHR as a procedure along with the interpretation.
**Dystonic Reaction**

**History**
- Medical history
- Medications
- Abuse or recreational use of prescription medications

**Signs and Symptoms**
- Restlessness
- Muscle spasms of the neck, jaw and back
- Oculogyric crisis
- A “dragging leg”
- Speech difficulties

**Differential**
- Trauma
- Stroke
- Tumor
- Hypoxia
- Infection
- Drug reactions
- Poisoning

---

**Pearls**
- Common drugs implicated in dystonic reactions include many anti-emetics and anti-psychotic medications including, but not limited to:
  - Prochlorperazine (Compazine)
  - Haloperidol (Haldol)
  - Metoclopramide (Reglan)
  - Promethazine (Phenergan)
  - Fluphenazine (Prolixin)
  - Chlorpromazine (Thorazine)
  - Many other anti-psychotic and anti-emetic drugs
- Rarely, benzodiazepine drugs have been implicated as a cause of dystonic reaction.

---

**Obtain vital signs**

**Consider, Oxygen**
(low flow unless altered or in respiratory distress or shock)

**Pulse oximetry**

**Cardiac monitor**

**Establish IV/IO**

**Diphenhydramine 50mg IV/IO/IM**

**Monitor and reassess**

**Notify receiving facility. Contact Base Hospital for medical direction, as needed.**

**Exit to AMS TG**

**Exit to appropriate respiratory TG**

**Exit to Hypotension / Shock TG**
Emergencies Involving Central Lines

**History**
- Central venous catheter type:
  - Tunneled catheter (Broviac/Hickman)
  - PICC (peripherally inserted center catheter)
  - Implanted catheter (Mediport)
  - Fistulas
  - Occlusion of line
  - Complete or partial dislodgement
  - Complete or partial disruption

**Signs and Symptoms**
- External catheter dislodgement
- Complete catheter dislodgement
- Damaged catheter
- Bleeding at catheter/fistula site
- Erythema, warmth, or drainage about catheter/fistula site indicating infection

**Differential**
- Fever
- Hemorrhage
- Reactions from home nutrient or medication
- Respiratory distress
- Shock
- Internal bleeding
- Blood clot
- Air embolus

---

**History Diagram**

1. **Airway, breathing, or circulation problem?**
   - No
   - **Damage to catheter?**
     - No
     - **Catheter completely or partially dislodged?**
       - No
       - **Hemorrhage at catheter site?**
         - No
         - **Suspected air embolus, tachypnea, dyspnea, or chest pain?**
           - No
           - **Ongoing infusion?**
             - Yes
               - Exit to appropriate TGs
             - No
               - **Continue infusion**
                 - Do not exceed 20ml/kg

2. **Yes**
   - Clamp catheter proximal to disruption
   - Stop infusion if ongoing
   - Apply direct pressure around catheter
   - Stop infusion if ongoing
   - Apply direct pressure around catheter
   - Place patient on left side in head down position
   - Stop infusion if ongoing
   - Clamp catheter proximal to disruption

---

**Pearls**
- Always talk to family/caregivers as they have specific knowledge and skills of device(s).
- If hemodynamically unstable and a peripheral IV or IO cannot be obtained, access central catheter and utilize for definitive care if device is functioning properly.
- Central venous access devices that require the penetration of skin, such as internal subcutaneous infusion ports may not be used.
- Use strict sterile techniques when accessing/manipulating a dialysis catheter device.
- Do not place a tourniquet or BP cuff on the same side where a PICC line is located.
- Do not attempt to force catheter open if occlusion is evident.
- Some infusions may be detrimental to stop. Ask family or caregiver if it is appropriate to stop or change infusion.
- Hyperalimentation infusions (IV nutrition): If stopped for any reason, monitor patient for hypoglycemia.

Contra Costa County Emergency Medical Services  

Hypotension/Shock  

History  
• Blood loss  
• Fluid loss (vomiting, diarrhea or fever)  
• Infection (e.g., UTI, cellulitis, etc.)  
• Cardiac ischemia (MI or CHF)  
• Medications  
• Allergic reaction  
• Pregnancy  
• History of poor oral intake  

Signs and Symptoms  
• Restlessness or confusion  
• Weakness or dizziness  
• Weak, rapid pulse  
• Pale, cool, clammy skin signs  
• Delayed capillary refill  
• Hypotension  
• Coffee-ground emesis  
• Tarry stools  

Differential  
• Shock (hypovolemic, cardiogenic, septic, neurogenic or anaphylaxis)  
• Ectopic pregnancy  
• Cardiac dysrhythmias  
• Pulmonary embolus  
• Tension pneumothorax  
• Medication effect or overdose  
• Vasovagal effect  
• Physiologic (pregnancy)

NO  

Effective Jan. 2021  

Treatment Guideline A12  
Page 1 of 2
Pearls

- Hypotension can be defined as a systolic blood pressure of less than 90mmHg. This is not always reliable and should be interpreted in context with the patient’s typical BP, if known. Shock may be present with a seemingly normal blood pressure initially.
- Shock is often present with normal vital signs and may develop insidiously. Tachycardia may be the only manifestation.
- Consider all causes of shock and treat per appropriate Treatment Guideline.
- Hypovolemic shock:
  - Hemorrhage, trauma, GI bleeding, ruptured AAA, or pregnancy-related bleeding
- Cardiogenic shock:
  - Heart failure, MI, cardiomyopathy, myocardial contusion, ruptured ventricle/septum/value or toxins
- Distributive shock:
  - Sepsis, anaphylactic, neurogenic, or toxins
  - Neurogenic shock generally presents with warm, dry, and pink skin with normal capillary refill time; patient typically alert
- Obstructive shock:
  - Pericardial tamponade, PE, or tension pneumothorax
  - Signs may include hypotension with distended neck veins, tachycardia, unilateral decreased breath sounds or muffled heart tones
History
- Ingestion or suspected ingestion of a potentially toxic substance
- Substance ingested, route, and quantity
- Time of ingestion
- Reason (suicidal, accidental or criminal)
- Available medications in home
- Past medical history and medications

Signs and Symptoms
- Mental status changes
- Hypo or hypertension
- Decreased respiratory rate
- Tachycardia or dysrhythmias
- Seizures
- S.L.U.D.G.E.

Differential
- Tricyclic antidepressants (TCAs)
- Acetaminophen (Tylenol)
- Aspirin
- Depressants
- Stimulants
- Anticholinergics
- Cardiac medications
- Solvents, alcohols or cleaning agents
- Insecticides (organophosphates)

Adequate respirations (> 8) and oxygenation?
Yes
- 12-Lead ECG
- IV/IO procedure
- Cardiac monitor

No
Exit to Opioid Overdose TG
as indicated

Altered mental status?
Yes
Blood glucose analysis
Exit to Diabetic/Behavioral TGs
as indicated

No
Systolic BP < 90
Exit to Hypotension/Shock TG
as indicated

If bradycardic and symptomatic
Exit to Symptomatic Bradycardia TG
as indicated

Tricyclic Antidepressant OD
- QRS ≥ 0.12 sec and BP < 90?
Yes
Sodium Bicarbonate
1mEq/kg IV/IO
No
Atropine 1-2mg IV/IO
Repeat every 3-5 minutes until relief of symptoms achieved

Organophosphate OD

Hydrofluoric Acid Exposure

Calcium Chloride
500mg IV/IO
(5ml of 10% solution)
For tetany or cardiac arrest
Consider
Fentanyl
50-200mcg IV
Titrated in 25-50mcg increments to pain relief
OR
Fentanyl
100mcg IN/IM if no IV access
May repeat once in 15 minutes

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.

Contact Base Hospital Physician for treatment or additional Fentanyl orders

Exit to Symptomatic Bradycardia TG
as indicated
Pears

- **Overdose or toxic ingestion** patients with significant ingestion/exposures should be monitored very closely and aggressively treated as indicated. Do not hesitate to contact the Base Hospital for advice as certain critically ill overdose patients may quickly overwhelm medication supplies. For example, a tricyclic overdose with a wide QRS and altered mental status may need to receive multiple Sodium Bicarbonate boluses until QRS narrowing and clinical improvement; patients with organophosphate toxicity with SLUDGE syndrome may require more Atropine than is usually available on an ambulance.

- Do not rely on patient history of ingestion, especially in suicide attempts. Make sure patient is still not carrying other medications or has any weapons.

- Bring medication bottles, contents, and emesis to the Emergency Department.

- S.L.U.D.G.E.: Salivation, Lacrimation, Urination, Defecation, GI distress, and Emesis

- Tricyclic: 4 major areas of toxicity include decreased mental status, dysrhythmias, seizures, hypotension then coma and death.

- Acetaminophen: Initially normal or with nausea/vomiting. If not detected and treated, causes irreversible liver failure.

- Aspirin: Early sign consist of abdominal pain and vomiting. Tachypnea and altered mental status may occur later. Renal dysfunction, liver failure or cerebral edema among other things can present later.

- Depressants: Decreased heart rate, blood pressure or temperature, decreased respirations, and non-specific pupils.

- Stimulants: Increased heart rate, blood pressure or temperature, dilated pupils, and seizures.

- Anticholinergics: Increased heart rate or temperature, dilated pupils, and mental status changes.

- Cardiac medications: Dysrhythmias and mental status changes.

- Solvents: Nausea, vomiting, coughing, and mental status changes.

- Insecticides: Increased or decreased heart rate, increased secretions, nausea, vomiting, diarrhea, and pinpoint pupils. Consider restraints if necessary for patient’s or personnel's protection per Restraint Procedure.

- Consider contacting the California Poison Control Center for Guidance.
History
- Hx of recent opioid drug use
- Hx of chronic opioid drug use
- Narcotic prescriptions in the household
- Evidence of illicit drug use (needles, paraphernalia)
- Hx of chronic medical conditions requiring opioid medication

Signs and Symptoms
- Altered mental status
- Depressed respiratory drive
- Pin point pupils
- Track marks
- Unconsciousness

Differential
- Diabetic emergency
- Stroke
- Neurologic disorder
- Non-opioid overdose
- Traumatic injury

---

**Altered mental status and respiratory rate < 8**

**Maintain airway patency and adequate ventilations**

**Naloxone 2-4 mg IN or Auto Injector**
Naloxone is titrated to effect of adequate ventilation and oxygenation
NOT ADMINISTERED TO RESTORE CONSCIOUSNESS

**Consider vascular access**

**Naloxone 2-4mg IN or Naloxone 1-2mg IV/IM**
Naloxone is titrated to effect of adequate ventilation and oxygenation
NOT ADMINISTERED TO RESTORE CONSCIOUSNESS

**Monitor and reassess**

**Cardiac monitor**

**Patient condition improve?**

**NO**

**Continue supportive care**

**Consider advanced airway**

**YES**

**History**

**Signs and Symptoms**
- Severity (pain scale)
- Quality (e.g. sharp, dull, or stabbing)
- Radiation
- Relation to movement or respiration
- Increased with palpation of area

**Differential**
- Per the specific TG
- Musculoskeletal
- Visceral (abdominal)
- Cardiac
- Pleural/respiratory
- Neurogenic
- Renal (colic)

**Signs and Symptoms**

**Differential**

**Position of comfort**

**Apply cold pack if applicable**

**Monitor and reassess**

**Consider IV/IO procedure**

**Assess and monitor respiratory status**

**Monitor continuous EtCO₂**

**Apply and monitor cardiac rhythm**

**Moderate to severe pain**

**Fentanyl 25 – 50mcg IV/IO**
- titrated in 25 – 50mcg increments to pain relief. Consider 25mcg increments in elderly patients
- Fentanyl 100mcg IN
  - If no IV access. May repeat once after 15 minutes
- Fentanyl 50 – 100mcg IM
  - If no IV access and IN route not advisable. May repeat once after 15 minutes
- Maximum of 200mcg total

**Monitor and reassess every 5 minutes following administration**

**Acetaminophen 1g IV/IO infusion over 15 minutes (single dose only)**
- Monitor and reassess every 5 minutes following administration

**Fentanyl or Ketamine**

**DO NOT ADMINISTER FENTANYL AND KETAMINE TO THE SAME PATIENT.**

**Fentanyl**
- Effective Jan. 2021

**Ketamine IV/IO**
- 500mg/10ml = 50mg/ml
- Weight Dose Volume
  - 50-69 kg 15mg 0.3 ml
  - 70-89 kg 20mg 0.4 ml
  - 90+ 30mg 0.6 ml
- Drawn in a tuberculin syringe

**Single dose only**

**Administer slowly over 2 minutes**

**Monitor and reassess every 5 minutes following administration**

**Consider for longer acting relief**

**Acetaminophen 1g IV/IO infusion over 15 minutes (single dose only)**
- Monitor and reassess every 5 minutes following administration

**Notify receiving facility. Contact Base Hospital for medical direction as needed**
**Pain Control**

- **Pearls**
  - DO NOT ADMINISTER FENTANYL AND KETAMINE TO THE SAME PATIENT.
  - Pain severity (0 – 10 scale) is a vital sign to be recorded before and after all BLS pain control measures and ALS pain medication delivery. Monitor blood pressure and respirations closely as pain control medications may cause hypotension or respiratory distress.
  - Patients may display a wide variation of response to opioid pain medication (Fentanyl). Consider the patient’s age, weight, clinical condition, other recent drugs, or alcohol and prior exposure to opiates when determining initial dosing. Minimal doses of opioids may cause respiratory depression in the elderly or those patients who weigh less.
  - USE EXTREME CAUTION when administering opioids together with benzodiazepines; this combination results in a deeper level of anesthesia with a significant risk for airway and respiratory compromise.
  - For patients who have a tolerance to opioids, non-narcotic therapies may be appropriate until evaluation at the receiving facility.
  - Acetaminophen may be administered once in addition to Fentanyl or Ketamine for patients with severe pain.
  - Do not administer Acetaminophen to patients with severe liver impairment or active liver disease.
  - Contraindications of Fentanyl and Ketamine include:
    - Closed head injury
    - Hypotension (BP < 90)
    - Altered level of consciousness
    - Respiratory failure/worsening status
    - Headache
    - Childbirth/suspected active labor
  - Have Naloxone available to reverse respiratory depression should it occur.
  - Burn patients may require higher than usual opioid doses to achieve adequate pain control. IF A PATIENT HAS SUFFERED BURNS THAT REQUIRE TRANSPORT TO A BURN CENTER, THE PATIENT MAY REQUIRE MORE THAN THE MAXIMUM TOTAL DOSE OF FENTANYL OR KETAMINE TO ACHIEVE PAIN CONTROL. CONTACT THE BASE HOSPITAL FOR ADDITIONAL ORDERS.
### History
- Birth defect
- Surgical complications
- Trauma
- Medical condition involving the airway or phrenic nerve

### Signs and Symptoms
- Nasal flaring
- Chest wall retractions (with or without abnormal breath sounds)
- Attempts to cough
- Copious secretions notes coming from the tube
- Faint breath sounds on both sides of the chest despite significant respiratory effort
- AMS
- Cyanosis

### Differential
- Allergic reaction
- Asthma
- Aspiration
- Septicemia
- Foreign body
- Infection
- Congenital heart disease
- Medication or toxin
- Trauma

---

**Pearls**
- Always talk to family/caregivers as they have specific knowledge and skills of device(s).
- Use extreme caution when placing an ETT into a stoma. Placing the ETT too deep will result in right main stem positioning.
- Use patient’s equipment if available and functioning properly.
- Estimate suction catheter size by doubling the inner tracheostomy tube diameter and rounding down.
- Suction depth: Ask family or caregiver. Suction no more than 3-6cm. Introduce 2-3ml NS before suctioning.
- Do not suction for more than 10 seconds each attempt and pre-oxygenate before and between attempts.
- DO NOT force the suction catheter. If unable to pass, the tracheostomy tube should be changed.
- Always deflate tracheal tube cuff before removal. Use continuous pulse oximetry and EtCO₂ monitoring.
Contra Costa County Emergency Medical Services

Seizure

History
• Reported or witnessed seizure
• Previous seizure history
• Medical alert tag
• Seizure medications
• History of trauma
• History of diabetes
• History of pregnancy
• Time of seizure onset
• Document number of seizures
• Alcohol use, abuse, or abrupt cessation
• Fever

Signs and Symptoms
• Altered mental status
• Sleepiness
• Incontinence
• Observed seizure activity
• Evidence of trauma
• Unconscious
• Incontinence

Differential
• Head trauma
• Metabolic, hepatic or renal failure
• Tumor
• Hypoxia
• Electrolyte abnormality
• Drugs or medication non-compliance
• Infection or sepsis
• Alcohol withdrawal
• Eclampsia
• Stroke
• Hyperthermia
• Hypoglycemia

---

**Status Epilepticus**
- 2 or more seizures in ≤ 5 minutes
- Any seizure lasting > 5 minutes

If duration cannot be confirmed, patient should be assumed to be in status if actively seizing when you arrived.

E
- Ensure scene safety
- Loosen any constrictive clothing
- Assess and manage ABCs
- Cardiac monitor

Status Epilepticus? (Confirmed or Suspected)

NO

NO

E
- Monitor and reassess
- Check blood glucose
- SMR if indicated
- Manage any traumatic injuries

YES

P
- Apply high flow O₂ via NRB
- Initiate BVM ventilation for apnea or ongoing hypoxia

Midazolam
- IM: 10mg (preferred route)
- IN: 10mg (5mg in each nare)
- IV/IO (if already established): 6mg – 8mg

If patient continues to seize, consider additional Midazolam with base contact

IF BGL ≤ 60mg/dl
Exit to Diabetic TG

Notify receiving facility. Contact Base Hospital for medical direction, as needed.

Effective Jan. 2021
Pearls

- Status Epilepticus is defined as two or more seizures without a period of consciousness or recovery, or one prolonged seizure lasting longer than 5 minutes. If patient is seizing upon EMS arrival this is likely status epilepticus. This is a true emergency requiring rapid airway control, treatment, and transport.
- Midazolam 10mg IM is effective in the termination of status epileptic. Do not delay IM administration to obtain IV or IO access in an actively seizing patient.
- Limit IN administrations to ½ dose in each nare.
- Be prepared to assist ventilations or manage the airway, especially if Midazolam is used.
- For a seizure that begins in the presence of EMS, if the patient was previously conscious, alert and oriented, take the time to assess and protect the patient and providers and CONSIDER THE CAUSE. The seizure may stop, especially in patients who have prior history of self-limiting seizures. However, do not hesitate to treat recurrent or prolonged (> 5 minute) seizure activity.
- Assess the possibility of occult trauma and substance abuse.
- Grand Mal seizures (generalized) are associated with a loss of consciousness, incontinence, and oral trauma.
- Focal seizures (Petit Mal) affect only a part of the body and are not associated with a loss of consciousness.
Contra Costa County Emergency Medical Services

Suspected Sepsis

History
- Age (common in elderly and very young)
- Presence and duration of fever
- Previously documented infection or illness (UTI, pneumonia, meningitis, encephalitis, cellulitis, or abscess)
- Recent surgery or invasive procedure
- Immunocompromised
- Bedridden or immobile patients
- Prosthetic or indwelling devices
- Immunization status

Signs and Symptoms
- Hyper or hypothermia
- Rash or excessive bruising
- Chills
- Myalgia
- Markedly decreased urine output
- AMS
- Delayed capillary refill
- Elevated blood glucose (unless diabetic)

Differential
- Shock (hypovolemic or cardiogenic)
- Dehydration
- Hyperthyroidism
- Medication or drug interaction
- Non-septic infection
- Allergic reaction or anaphylaxis
- Toxicological emergency

**History**

**Signs and Symptoms**

**Differential**

---

**History**

- Age (common in elderly and very young)
- Presence and duration of fever
- Previously documented infection or illness (UTI, pneumonia, meningitis, encephalitis, cellulitis, or abscess)
- Recent surgery or invasive procedure
- Immunocompromised
- Bedridden or immobile patients
- Prosthetic or indwelling devices
- Immunization status

---

**Signs and Symptoms**

- Hyper or hypothermia
- Rash or excessive bruising
- Chills
- Myalgia
- Markedly decreased urine output
- AMS
- Delayed capillary refill
- Elevated blood glucose (unless diabetic)

---

**Differential**

- Shock (hypovolemic or cardiogenic)
- Dehydration
- Hyperthyroidism
- Medication or drug interaction
- Non-septic infection
- Allergic reaction or anaphylaxis
- Toxicological emergency

---

**Flowchart Diagram**

- Consider appropriate PPE and infection control measures
- Establish IV/IO
- Cardiac monitor
- EtCO2 monitoring

---

**Initial Steps**

- Obvious or suspected infection AND any TWO of the following criteria:
  - Respiratory rate ≥ 20
  - Temperature > 100.4° or < 96.8°
  - Heart Rate > 90

- **BP < 90/ Shock?**

---

**Initial Steps**

- Start Normal Saline 500mL bolus IV/IO
- Repeat 500 mL bolus to Maximum of 1L
- Discontinue if signs of Fluid Overload develop
- *See Pearls*

---

**Consider Base contact for Push Dose Epi in patients with severe hypotension refractory to fluid bolus**

- See drug reference

---

**Declaration**

- Declared a Sepsis Alert

---

**Notify**

- Notify receiving facility.
- Contact Base Hospital for medical direction, as needed.
Pearls

- Early recognition of sepsis allows for attentive care and early administration of antibiotics.
- Aggressive IV fluid therapy is the most important prehospital treatment for sepsis. Suspected sepsis patients should receive repeated fluid boluses (to a Maximum of 2L) while being checked frequently for signs of pulmonary edema, especially in patients with a known history of CHF or ESRD on dialysis. STOP fluid administration in the setting of pulmonary edema.
- Septic patients are especially susceptible to traumatic lung injury and ARDS. If artificial ventilation is necessary, avoid ventilating with excessive tidal volumes. Use only enough tidal volume to see the chest rise. If CPAP is utilized, airway pressure should be limited to 7.5cm H₂O if using a rate adjustable device.
- Attempt to identify source of infection (e.g. skin, respiratory, etc.) and relay previous treatments and related history to receiving ED physician.
- Disseminated Intravascular Coagulation (DIC) is an ominous, late stage manifestation of sepsis characterized by frank, extensive bruising, bleeding from multiple sites, and finally tissue death.
**Suspected Stroke**

**History**
- Previous stroke or TIA
- Previous cardiac or vascular surgery
- Associated diseases (diabetes, hypertension, CAD)
- Atrial fibrillation
- Medications (blood thinners)
- History of trauma

**Signs and Symptoms**
- Altered mental status
- Weakness or paralysis
- Blindness or other sensory loss
- Aphasia or dysarthria
- Syncope
- Vertigo or dizziness
- Vomiting
- Headache
- Seizure
- Respiratory pattern change
- Hypertension/hypotension

**Differential**
- See Altered Mental Status
- TIA
- Seizure
- Todd’s paralysis
- Hypoglycemia
- Stroke
  - Thrombotic or embolic (~85%)
  - Hemorrhagic (~15%)
- Tumor
- Trauma
- Dialysis or renal failure

---

**Treatment Guideline A18**

**Effective** Jan. 2016

**Contra Costa County Emergency Medical Services**
A Stroke Alert is indicated when the Cincinnati Stoke Screen findings are abnormal and onset (time last seen normal) is less than 6 hours from time of patient contact. Report time last seen normal (clock time), the medical record number or name and birthdate, results of the Cincinnati Stroke Screen and the LAMS score, physical exam, and ETA using an approved report format.

If a family member or guardian is available, assure their availability by either transporting them in the ambulance or obtain their name and phone number to allow the receiving physician to contact them. Encourage a family member to be available to speak with hospital staff.

- If any portion of the Cincinnati Stroke Screen is abnormal and it is a new finding, the stroke screen is positive and may indicate an acute stroke.
- Pre-arrival information is necessary for the receiving hospital to make rapid treatment and potential transfer decisions.
- Because the patient may need to receive thrombolytic therapy, avoid multiple IV attempts.
- Avoid distal placement of IVs, if possible, as this is a preferred access site by Interventionalists.
- When turning over patient care to hospital staff, make sure to include common anticoagulants taken by the patient. Known use of these medications may affect the course of hospital treatment:
  - Warfarin (Coumadin)
  - Heparin
  - Fondaparinux (Arixtra)
  - Enoxaparin (Lovenox)
  - Dabigatran (Pradaxa)
  - Apixaban (Eliquis)
  - Rivaroxaban (Xarelto)

### Table: Cincinnati Stroke Screen

<table>
<thead>
<tr>
<th>Finding</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facial Droop</td>
<td>Normal: Symmetrical smile or face</td>
</tr>
<tr>
<td></td>
<td>Abnormal: Asymmetry</td>
</tr>
<tr>
<td>Arm Weakness</td>
<td>Normal: Both arms move symmetrically</td>
</tr>
<tr>
<td></td>
<td>Abnormal: Asymmetrical arm movement</td>
</tr>
<tr>
<td>Speech Abnormality</td>
<td>Normal: Correct words; no slurring</td>
</tr>
<tr>
<td></td>
<td>Abnormal: Slurred or incorrect words</td>
</tr>
</tbody>
</table>

### Table: LAMS Assessment

<table>
<thead>
<tr>

<tbody>
<tr>
<td>Facial Droop</td>
<td>Absent</td>
<td>Normal: Symmetrical smile or face</td>
</tr>
<tr>
<td></td>
<td>Present</td>
<td>Abnormal: Asymmetry</td>
</tr>
<tr>
<td>Arm Weakness</td>
<td>Absent</td>
<td>Normal: Both arms move symmetrically</td>
</tr>
<tr>
<td></td>
<td>Drifts</td>
<td>Abnormal: Asymmetrical arm movement</td>
</tr>
<tr>
<td></td>
<td>Falls</td>
<td>Falls rapidly: some or no effort</td>
</tr>
<tr>
<td>Grip</td>
<td>Normal</td>
<td>Normal: Equal grip in both hands</td>
</tr>
<tr>
<td></td>
<td>Weak</td>
<td>Weak: Unequal grip in one hand</td>
</tr>
<tr>
<td></td>
<td>No grip</td>
<td>No grip: no muscle strength or contraction</td>
</tr>
</tbody>
</table>

A LAMS score of ≥ 4 indicates a high likelihood of a LVO stroke.

### Pearls

- **Acute stroke care is evolving rapidly.**
- **Time last seen normal:** One of the most important items that prehospital providers can obtain, on which all treatment decisions are based. Be very precise in gathering data to establish the time of onset and report as an actual time (i.e. 13:45 NOT “about 45 minutes ago”). Without this information, patients may not be able to receive thrombolytics at the hospital. For patients with “woke up and noticed stroke symptoms,” time starts when the patient was last awake.
- The differential listed on the Altered Mental Status TG should also be considered.
- Be alert for airway problems (difficulty swallowing, vomiting and aspiration).
- Hypoglycemia can present as a LOCALIZED neurologic deficit, especially in the elderly.
- Document the Cincinnati Stroke Screen and LAMS in the EHR.
**Syncope**

**History**
- History of cardiac, stroke or seizures
- Occult blood loss (GI or ectopic)
- Females: LMP or vaginal bleeding
- Fluid loss: nausea, vomiting or diarrhea
- Past medical history
- Medications

**Signs and Symptoms**
- Loss of consciousness with recovery
- Lightheadedness or dizziness
- Palpitations, slow or rapid
- Pulse irregularity
- Hypotension

**Differential**
- Vasovagal
- Orthostatic hypotension
- Cardiac syncope
- Micturition or defecation syncope
- Psychiatric
- Stroke
- Hypoglycemia
- Seizure
- Shock
- Toxicological (alcohol)
- Medication effect (hypertension
- Pulmonary embolism
- AAA

**Flowchart**
- **Diabetic TG if indicated**
  - Consider orthostatic vital signs
    - Blood glucose analysis
    - Cardiac monitor
    - 12-Lead ECG
    - Consider IV/IO
  - Suspected or evident trauma
    - Yes: Spinal Immobilization TG if indicated
    - No: Altered mental status
      - Yes: Altered Mental Status TG if indicated
      - No: Hypotension or poor perfusion
        - Yes: Hypotension / Shock TG if indicated
        - No: Contact the Base Hospital for all AMA requests
          - Notify receiving facility. Contact Base Hospital for medical direction, as needed.
Pearls

- Utilize the Base Hospital for syncopal patients who do not want transport to a hospital.
- Assess for signs and symptoms of trauma or head injury if associated with a fall or if it is questionable whether the patient fell due to syncope.
- Consider dysrhythmias, GI bleed, ectopic pregnancy, and seizure as possible cause of syncope.
- Syncope patients should be transported to a hospital for physician evaluation.
- More than 25% of geriatric syncope is cardiac dysrhythmia based.
Contra Costa County Emergency Medical Services

Vomiting and Diarrhea

### History
- Age
- Time of last meal
- Last emesis/bowel movement
- Improvement or worsening with food or activity
- Duration of problem
- Other sick contacts
- Past medical history
- Past surgical history
- Medications
- Menstrual history (Pregnancy)
- Travel history
- Bloody emesis/diarrhea

### Signs and Symptoms
- Abdominal pain
- Character of pain (constant, intermittent, dull, sharp, etc.)
- Distension
- Constipation
- Diarrhea
- Anorexia
- Radiation

### Associated symptoms (helpful to localize source):
- Fever, headache, blurred vision, weakness, malaise, myalgia, cough, dysuria, mental status changes, and rash

### Differential
- CNS (increased pressure, headache, stroke, CNS lesions, trauma or hemorrhage, vestibular)
- MI
- Drugs (NSAIDs, antibiotics, narcotics, chemotherapy)
- GI or renal disorders
- Diabetic ketoacidosis
- Gynecologic disease (ovarian cyst, PID)
- Infections (pneumonia, influenza)
- Electrolyte abnormalities
- Food or toxin induced
- Medication or substance abuse
- Pregnancy
- Psychological

---

**Pearls**

- Ondansetron is not indicated or useful for motion sickness.
- Document the mental status and vital signs prior to administration of anti-emetics.

---

**Treatment Guideline A20**

Follow Pediatric VF/VT
P Neonatal Cardiac and Airway TGs as indicated

---

**No**

---

**E** Basic airway procedure

---

**Notify receiving facility.**
Contact Base Hospital for medical direction, as needed.

---

**Exit to Newly Born TG**
Pearls

• Efforts should be directed at high quality chest compressions with limited interruptions and early defibrillation when indicated. Compress 1.5 inches in infants and 2 inches in children. Consider early IO placement if available or direct IV access if anticipated.
• DO NOT HYPERVENTILATE.
• Do not delay chest compressions while applying any device or intervention.
• In cases of clear-cut traumatic arrest, epinephrine is not indicated in PEA or asystole. Epinephrine will not correct arrest caused by a tension pneumothorax, cardiac tamponade, or hemorrhagic shock. If there is any doubt as to the cause of arrest, treat as a non-traumatic arrest.
• Use a metronome during chest compression to ensure proper rate.
• Airway is a more important intervention in pediatric arrests. This should be accomplished quickly with a BVM and appropriately sized mask. Patient survival is often dependent on proper ventilation and oxygenation.
• Resuscitation is based on proper planning and organized execution. Procedures require space and patient access. Make room to work. Utilize team focused approach assigning responders to predetermined tasks.
• Prevent hypothermia by moving to a warm environment and avoid unnecessary exposure.
**History**
- Events leading to arrest
- Estimated downtime
- Past medical history
- Medications
- Existence of terminal illness
- Airway obstruction
- Hypothermia
- Suspected abuse (shaken baby syndrome, pattern of injuries)
- SIDS

**Signs and Symptoms**
- Apneic
- Pulseless

**Differential**
- Respiratory failure
- Foreign body
- Hypothermia
- Infection
- Congenital heart disease
- Trauma
- Tension pneumothorax
- Toxin or medication
- Acidosis
- Hyperkalemia
- Hypoglycemia

---

**Pediatric Cardiac Arrest TG**

Criteria for death/no resuscitation
Review DNR/POLST form

Resume chest compressions
- Push hard (1.5 inches Infant / 2 inches Children) and fast (100-120/min)
- Change compressors every 2 minutes (Limit changes / pulse checks to < 5 seconds)

Shockable rhythm?

Search for reversible causes
- Establish IV/IO
- Epinephrine (1:10,000) IO/IV
  - Repeat every 3 to 5 minutes
  - Use Pediatape and refer to dosing guide
- Normal saline fluid bolus IO/IV
  - Use Pediatape and refer to dosing guide
  - Consider Chest Decompression Procedure

Criteria for discontinuation?

---

**AT ANY TIME**

Return of spontaneous circulation

Go to Post Resuscitation TG

**Reversible Causes**
- Hypovolemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypothermia
- Hypo / Hyperkalemia
- Hypoglycemia
- Tension pneumothorax
- Tamponade (cardiac)
- Toxins
- Thrombosis (pulmonary)(PE)
- Thrombosis (coronary)(MI)

**Discontinue Resuscitation**
Follow Policy 1004 – Determination of Death

---

**Pearls**
- Patients with a rapid pulseless rate are most likely hypovolemic. Fluid will likely reverse this condition.
- In order to be successful in pediatric arrests, a cause must be identified and corrected.
- Respiratory arrest is a common case of cardiac arrest. Unlike adults, early airway intervention is critical.
- In most cases, pediatric airways can be maintained with basic interventions.

Pearls

- Efforts should be directed at high quality chest compressions with limited interruptions and early defibrillation when indicated. Compress 1.5 inches in infants and 2 inches in children. Consider early IO placement if available or direct IV access if anticipated.
- DO NOT HYPERVENTILATE.
- Use a metronome during chest compression to ensure proper rate.
- Airway is a more important intervention in pediatric arrests. This should be accomplished quickly with a BVM. Patient survival is often dependent on proper ventilation and oxygenation with airway intervention.
- In order to be successful in pediatric arrests, a cause must be identified and corrected.
- Respiratory arrest is a common cause of cardiac arrest. Unlike adults, early ventilation intervention is critical.
- In most cases, pediatric airways can be managed by basic intervention with a BVM.
- Reassess and document ETT placement (patients above 40kg) and EtCO₂ frequently, after every move, and at transfer of care.
- Do not stop chest compressions to check for placement of ETT or to give medications.
**History**
- Respiratory arrest
- Cardiac arrest

**Signs and Symptoms**
- Return of spontaneous circulation

**Differential**
- Continue to address specific differentials associated with the original dysrhythmia

---

**Repeat primary assessment**

**Optimize ventilation and oxygenation**
- Maintain SpO2 ≥ 94%
- Maintain respiratory rate of 10/minute for EtCO2 35 – 45
- Remove impedance threshold device, if used
- **DO NOT HYPERVENTILATE**

**Monitor vital signs**

**For patients > 40kg**
- Intubate with ETT as appropriate
- or
- Place i-Gel, refer to weight-based guide

**Establish IV/IO**

- **Hypotension?**
  - (age based)
  - **Yes**
  - **Pediatric Bradycardia TG**
  - **Yes**
  - **Pediatric Diabetic TG**
  - **Yes**
  - **Normal Saline bolus IV/IO**
    - Use Pediatape and refer to dosing guide
  - **No**

- **No**
  - **Symptomatic Bradycardia?**
    - **Yes**
    - **Consider, sedation if advanced airway in place**
    - Midazolam IV/IO
    - Use Pediatape and refer to dosing guide
    - Monitor for hypotension
  - **No**

- **Blood glucose ≤ 60 or ≥ 350?**
  - **Yes**
  - **Consider, sedation if advanced airway in place**
  - Midazolam IV/IO
  - Use Pediatape and refer to dosing guide
  - Monitor for hypotension
  - **Notify receiving facility.**
  - **Contact Base Hospital for medical direction, as needed.**

---

**Pearls**
- Hyperventilation is a significant cause of hypotension/recurrence of cardiac arrest in the post resuscitation phase and must be avoided at all costs.
**History**
- Past medical history
- Foreign body exposure
- Respiratory distress or arrest
- Apnea
- Possible toxic or poison exposure
- Congenital disease
- Medication (maternal or infant)

**Signs and Symptoms**
- Decreased heart rate
- Delayed capillary refill or cyanosis
- Mottled, cool skin
- Hypotension or arrest
- Altered mental status
- Syncope

**Differential**
- Respiratory failure
  - Foreign body
  - Secretions
  - Infection (e.g. croup, epiglottitis)
- Hypovolemia
- Congenital heart disease
- Trauma
- Tension Pneumothorax
- Hypothermia
- Toxin or medication
- Hypoglycemia
- Acidosis

**Pearls**
- The majority of pediatric bradycardia is due to airway problems.
- Hypoglycemia, severe dehydration and narcotic effects may produce bradycardia.
- Most maternal medications pass through breast milk to the infant.
History
- Past medical history
- Medications or toxic ingestion (e.g. Aminophylline, Adderall, diet pills, thyroid supplements, decongestants and Digoxin)
- Drugs (e.g. nicotine and illegal drugs)
- Congenital heart disease
- Respiratory distress
- Syncope / near syncope

Signs and Symptoms
- Heart rate: Child > 180
  Infant > 220
- Pale or cyanosis
- Diaphoresis
- Tachypnea
- Vomiting
- Hypotension
- Altered mental status
- Pulmonary congestion
- Syncope

Differential
- Heart disease (congenital)
- Hypo / Hyperthermia
- Hypovolemia or anemia
- Electrolyte imbalance
- Anxiety / Pain / Emotional stress
- Fever / Infection / Sepsis
- Hypoxia
- Hypoglycemia
- Medication / Toxin / Drugs
- Pulmonary embolus
- Trauma
- Tension Pneumothorax

Assess symptom severity

Unstable
- Cardiac monitor
- Establish IV/IO
- 12-Lead ECG
- ETCO₂ monitoring
- Attempt Valsalva maneuver

Probable SVT
(QRS ≤ 0.09 sec)

Adenosine IV/IO
Rapid push
Use Pediatape and refer to dosing guide

Probable V-Tach
(QRS ≥ 0.09 sec)

Cardioversion Procedure
- Consider sedation pre-cardioversion
  Midazolam IV/IO
  Use Pediatape and refer to dosing guide
  Max 5mg

Synchronized cardioversion
Use Pediatape and refer to dosing guide
May repeat if necessary – refer to dosing guide for repeat energy doses

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.

Base Hospital orders are required for all of the following treatments

Stable
- Cardiac monitor
- Monitor and reassess
- 12-Lead ECG

ETCO₂ monitoring
- Consider, IV/IO
Pearls

- Most important goal is to differentiate the type of tachycardia and if STABLE or UNSTABLE.
- Unstable is defined by poor perfusion with AMS, abnormal pulses, delayed capillary refill, or difficult or unable to palpate a blood pressure.
- If at any point the patient becomes unstable, move to the unstable arm of the algorithm.
- Early transport is always appropriate in unstable patients.
- For ASYMPTOMATIC patients (or those with only minimal symptoms, such as palpitations) and any tachycardia with a rate of < 150 with a normal blood pressure, consider CLOSE OBSERVATION or fluid bolus rather than immediate treatment with an anti-arrhythmic medication.
- Use Pediatape for pediatric weight measurement. ALWAYS use the weight-based dosing guide.
- Separating the child from the caregiver may worsen the child’s clinical condition.
- Pediatric pads should be used in children < 10kg or Pediatape measurement of Purple.
- Monitor for respiratory depression and associated hypotension associated if Midazolam is used.
**Contra Costa County Emergency Medical Services**

**Pediatric Airway**

---

**Assess respiratory rate, effort, oxygenation**

*Is airway/breathing adequate?*

- **No**

  **Basic maneuvers first**
  - Open airway chin lift/jaw thrust
  - Nasal or oral airway
  - Bag-valve mask (BVM)

  **Spinal motion restriction if indicated**

  **Yes**

  **Exit to appropriate TG**

---

**Airway foreign body obstruction procedure**

- **No**

  **Complete obstruction?**
  - **No**
  - **Yes**
    - **Airway patent?**
      - **No**
      - **Yes**
        - **Breathing/oxygenation support required?**
          - **No**
          - **Yes**
            - **Supplemental oxygen via BVM**
            - **Monitor/reevaluate supplemental oxygen if indicated**
            - **Exit to appropriate TG**

  **Yes**

  **Abdominal thrusts (conscious)**
  **Chest compression (unconscious)**

  **Direct laryngoscopy**

---

**Transport to closest receiving facility**

---

**The maximum allowed attempts for an advanced airway placement is two (2).**

If an attempt fails, reassess and approach with a different technique.

---

**For patients > 15 years of age in cardiac arrest**

Place i-Gel as appropriate

---

**For patients > 40kg**

Intubate with ETT as appropriate or Place i-Gel, refer to weight-based guide

---

**Consider, sedation if i-Gel or ETT in place**

- Midazolam IV/IM/IO
  - Use Pediatape and refer to dosing guide

---

**Notify receiving facility. Contact Base Hospital for medical direction, as needed.**

---

**Supplement oxygen**

*Goal oxygen saturation ≥ 94%*

**Exit to appropriate TG**

---

**Effective Jan. 2016**

---

**Treatment Guideline P01**

Page 1 of 2
Pearls

- Placement of an advanced airway is not a priority during the first five minutes of resuscitation unless ventilation is unable to be maintained with basic maneuvers.
- Endotracheal intubation is only approved for patients over 40kg.
- Capnometry is mandatory with all methods of airway management. Document results.
- Continuous capnometry (EtCO₂) is mandatory for the monitoring of all respiratory patients.
- If an effective airway is being maintained with a BVM and a basic airway adjunct with continuous pulse oximetry values of ≥ 90% or values expected based on pathophysiologic condition with otherwise reassuring vital sign (e.g. pulse oximetry of 85% with otherwise normal vital signs in a post-drowning patient), it is expected to continue with basic airway measures.
- For the purposes of this TG, a secure airway is achieved when the patient is receiving appropriate oxygenation and ventilation.
- An intubation attempt is defined as inserting the laryngoscope blade with the intent to intubate or inserting advanced airway past the teeth.
- An appropriate ventilatory rate is one that maintains an EtCO₂ of 35 or greater. Avoid hyperventilation.
- Patients with perfusing pulses should be managed with a BLS airway unless unable to successfully ventilate.
- Contraindications for i_Gel:
  - Presence of gag reflex
  - Caustic ingestion
  - Known esophageal disease
  - Laryngectomy with stoma (alternatively place ET in stoma)
- Effective use of a BVM requires two (2) people.
- Airway is a more important intervention in pediatric arrests. This should be accomplished quickly with a BVM and appropriately sized mask. Patient survival is often dependent on proper ventilation and oxygenation.
- Maintain spinal immobilization for patients with suspected spinal injury.
- Hyperventilation in deteriorating head trauma should only be done to maintain an EtCO₂ of 30-35.
- It is important to secure the advanced airway well and consider c-collar (in the absence of trauma) to better maintain advanced airway placement. Manual stabilization of advanced airway should be used during all patient moves/transfers.
Pediatric Allergic Reaction/Anaphylaxis

History
- Onset and location
- Insect sting or bite
- Food allergy / exposure
- Medication allergy / exposure
- New clothing, soap or detergent
- Past history of reactions
- Past medical history
- Medication history

Signs and Symptoms
- Itching or hives
- Coughing, wheezing or respiratory distress
- Chest or throat restriction
- Difficulty swallowing
- Hypotension or shock
- Edema
- Nausea or vomiting
- Feeling of impending doom

Differential
- Urticaria (rash only)
- Anaphylaxis (systemic effect)
- Shock (vascular effect)
- Angioedema (drug induced)
- Aspiration or airway obstruction
- Vasovagal event
- Asthma or COPD
- CHF

Assess symptom severity

Systemic
- Administer weight appropriate Epinephrine auto injector or assist patient with their prescribed auto injector

Localized
- Consider IV/IO
- Cardiac monitor
- Consider Diphenhydramine IM/IV/IO
- Refer to weight-based dosing guide

Airway Procedure
- Monitoring
- If indicated

Notify receiving facility.
- Contact Base Hospital for medical direction, as needed.

Auto injector use for pediatric patient ≤ 30 kg – Pediatric >30 kg - Adult
Pearls

- Anaphylaxis is an acute and potentially lethal multisystem allergic reaction.
- Epinephrine is the drug of choice and the first drug that should be administered in acute anaphylaxis reactions with moderate or severe symptoms. IM Epinephrine should be administered as priority before or during attempts at IV or IO access.
- Anaphylaxis unresponsive to repeat doses of IM Epinephrine may require IV Epinephrine administration. Contact the Base Hospital for refractory anaphylaxis.
- Allergic reactions may occur with only respiratory and gastrointestinal symptoms and have no rash or skin involvement.
- All patients with respiratory symptoms must have continuous pulse oximetry and EtCO₂ measurement.
- The shorter the onset of symptoms from contact with an allergen, generally the more severe the reaction.
Contra Costa County Emergency Medical Services

Pediatric Altered Mental Status

**History**
- Past medical history
- Medications
- Recent illness
- Irritability
- Lethargy
- Changes in feeding/sleeping
- Diabetes
- Potential ingestion
- Trauma

**Signs and Symptoms**
- Decrease/change in mentation
- Decrease/increase in blood sugar
- Cool, diaphoretic skin
- Warm, dry skin; fruity breath; Kussmaul respirations; signs of dehydration

**Differential**
- Hypoxia
- CNS (stroke, tumor, seizure, infection)
- Thyroid
- Shock
- Diabetes
- Toxicological
- Acidosis or alkalosis
- Diabetes
- Environmental exposure
- Psychiatric disorder
- Sepsis

---

**Treatment Diagram**

1. **Airway TG, if indicated**
   - Blood glucose analysis
   - Cardiac monitor
   - 12-Lead ECG, if indicated
   - Establish IV/IO

2. **Blood glucose ≤ 60 or ≥ 350**
   - Yes → **Exit to Diabetic TG**
   - No → **Signs of shock/poor perfusion**
     - Yes → **Exit to Hypotension/Shock TG**
     - No → **Signs of OD/toxic exposure**
       - Yes → **Exit to Overdose/Toxic Exposure TG**
       - No → **Signs of stroke or seizure**
         - Yes → **Exit to Stroke or Seizure TG as indicated**
         - No → **Signs of hypo/hyperthermia**
           - Yes → **Exit to Hypo/Hyperthermia TG as indicated**
           - No → **Arrhythmia/STEMI**
             - Yes → **Exit to Appropriate Cardiac TG as indicated**
             - No → **Notify receiving facility. Contact Base Hospital for medical direction, as needed.**

---

**Effective Jan. 2016**
Contra Costa County Emergency Medical Services

Pediatric Behavioral

**History**
- Situational crisis
- Psychiatric illness/medications
- Injury to self or threats to others
- Medical alert tag
- Substance abuse/overdose
- Diabetes

**Signs and Symptoms**
- Anxiety, agitation or confusion
- Affect change or hallucinations
- Delusional thoughts or bizarre behavior
- Combative or violent
- Expression of suicidal/homicidal thoughts

**Differential**
- Altered mental status
- Alcohol intoxication
- Toxin/substance abuse
- Medication effect/overdose
- Withdrawal symptoms
- Depression
- Bipolar (manic-depressive)
- Schizophrenia
- Anxiety disorders
- Hypoglycemia

**Excited Delirium Syndrome**
- Paranoia, disorientation, extremely agressive or violent, hallucinations, tachycardia, increased strength, hyperthermia, and clearly a danger to self or others

For patients ≥ 12 years of age
- Midazolam
  Use Pediatape and refer to dosing guide

Consider restraints
- Monitor restraints and PMS if indicated
- Consider external cooling measures
- Monitor and reassess
- Blood glucose analysis
- Establish IV
- Cardiac monitor

**Diabetic TG**
- if indicated

Exit to appropriate TG, if indicated
- Altered Mental Status TG
- Overdose/Toxic Ingestion TG
- Head Trauma TG

Assume patient has medical cause of behavioral change

Notify receiving facility.
- Contact Base Hospital for medical direction, as needed.

**Exit to appropriate TG, if indicated**

Midazolam
- Contact Base Hospital for additional order
Excited Delirium Syndrome:

This is a medical emergency. The condition is a combination of delirium, psychomotor agitation, anxiety, hallucinations, speech disturbances, disorientation, violent/bizarre behavior, insensitivity to pain, hyperthermia and increased strength. The condition is life-threatening and is often associated with use of physical control measures, including physical restraints, and tasers. Most commonly seen in male patients with a history of serious mental illness or drug abuse, particularly stimulant drugs such as cocaine, crack cocaine, methamphetamine, amphetamines, bath salts, or similar agents. Alcohol withdrawal or head injury may also contribute to the condition.

Pearls
- Crew/responder safety is the main priority. See Policy 1008 – Managing Assaultive Behavior/Patient Restraint.
- Avoid using benzodiazepines for patients with alcohol intoxication.
- Limit IN administrations to ½ dose in each nare.
- All patients who receive either physical restraint or chemical sedation must be continuously observed by EMS personnel. This includes direct visualization of the patient as well as cardiac and pulse oximetry monitoring.
- Consider all possible medical/trauma causes for behavior (e.g. hypoglycemia, overdose, substance abuse, hypoxia, seizure, head injury, etc.).
- Use caution when considering the use of Midazolam with postictal patients.
- Do not irritate the patient with a prolonged exam. Be thorough but quick.
- Do not overlook the possibility of associated domestic violence or child abuse.
- If patient suspected of excited delirium and suffers cardiac arrest, consider fluid bolus and sodium bicarbonate early.
- Do not position or transport any restrained patient in a way that negatively affects the patient’s respiratory or circulatory status (e.g. hog-tied or prone positions). Do not place backboards, splints or other devices on top of the patient.
- If restrained, the extremities that are restrained will have a circulation check at least every 15 minutes. The first of these checks should occur as soon after placement of the restraints as possible. This shall be documented in the EHR.
**History**
- Recent trauma, infection (e.g., fever, cough)
- GERD
- Congenital heart disease
- Seizures
- Medications

**Signs and Symptoms**
- Brief decrease/change in mentation
- Brief period of cyanosis or pallor
- Brief absence, decrease or irregular respirations
- Brief marked change in muscle tone
- Brief altered responsiveness

**Differential**
- GERD
- Pertussis
- Respiratory infection
- Seizure
- Infection
- Abuse

**History**
An infant ≤ 1 year who experienced an episode frightening to the observer, which is characterized by:
- cyanosis or pallor
- absent, decreased, or irregular breathing
- choking or gagging
- change in muscle tone
- altered level of consciousness

**Diagnostic Tests**
- Airway TG, if indicated
- Blood glucose analysis
- Cardiac monitor
- 12-Lead ECG, if indicated

**Pearls**
- BRUE was formally known as Apparent Life Threatening Event (ALTE).
- BRUE is formally diagnosed in the ED only when there is no explanation for a qualifying event after a physician conducts an appropriate history and physical examination.
- Always consider non-accidental trauma in any infant who presents with BRUE.
- Even with a normal physical examination at the time of EMS contact, patients that have experienced BRUE should be transported for further evaluation.
- It is important to document sleeping position as parent co-sleeping with child is associated with infant deaths.

**Contact**
Contact the Base Hospital for all AMA requests.

**Notify receiving facility.**
Contact Base Hospital for medical direction, as needed.
History
- Past medical history
- Medications
- Recent blood glucose check
- Last meal

Signs and Symptoms
- Altered mental status
- Combative or irritable
- Diaphoresis
- Seizure
- Abdominal pain
- Nausea or vomiting
- Weakness
- Dehydration
- Deep or rapid breathing

Differential
- Alcohol or drug use
- Toxic ingestion
- Trauma or head injury
- Seizure
- Stroke
- Altered baseline mental status

Pearls
- Do not administer oral glucose to patients that are not able to swallow or protect their airway.
- Patients with prolonged hypoglycemia may not respond to Glucagon.
Contra Costa County Emergency Medical Services

Pediatric Hypotension/Shock

**History**
- Blood loss
- Vomiting
- Diarrhea
- Fever
- Infection

**Signs and Symptoms**
- Restlessness or confusion
- Weakness or dizziness
- Weak, rapid pulse
- Pale, cool, clammy skin signs
- Delayed capillary refill
- Hypotension
- Tarry stools

**Differential**
- Shock (hypovolemic, cardiogenic, septic, neurogenic, or anaphylaxis)
- Trauma
- Infection
- Dehydration
- Congenital heart disease
- Medication or toxin

**Diabetic TG if indicated**

**Blood glucose analysis**

**IV/IO procedure**

**Cardiac monitor**

**Consider 12-Lead ECG**

**Airway TGs if indicated**

**History, exam and circumstances often suggest (type of shock)**

**WAS TRAUMA INVOLVED?**

**Yes**

- Spinal motion restriction, if indicated

- CONTROL HEMORRHAGE and wound care, as indicated

- Normal Saline bolus IV/IO
  - Use Pediatape and refer to dosing guide
  - Repeat to age dependent goal SBP Maximum 1L

- Chest Decompression procedure if indicated

- Exit to Trauma TG if indicated

**No**

- Consider hypovolemic (dehydration or GI bleed), cardiogenic (STEMI or CHF), distributive (sepsis or anaphylaxis) and obstructive (PE or cardiac tamponade) shock

- Normal Saline bolus IV/IO
  - Use Pediatape and refer to dosing guide
  - Repeat to age dependent goal SBP Maximum 1L

- Exit to appropriate TG

**Notify receiving facility. Contact Base Hospital for medical direction, as needed.**

**MD**

**Normal Saline**

**Contact Base Hospital Physician for additional order**
Pearls

- Hypotension is age dependent. This is not always reliable and should be interpreted in context with the patient’s typical BP, if known. Shock may be present with a seemingly normal blood pressure initially.

  Hypotension is defined as:
  - Neonate: < 60mmHg or weak pulses
  - Infant: < 70mmHg or weak pulses
  - 1-10 years: < 70mmHg + (age in years x2)
  - Over 10 years: < 90mmHg

- Systemic BP goals are defined as:
  - Neonate: > 60mmHg
  - Infant: > 70mmHg
  - 1-10 years: > 70mmHg + (age in years x2)
  - Over 10 years: > 90mmHg

- Common pediatric terms used to describe children are defined as:
  - Newly born are ≤ 24 hours old
  - Neonates are ≤ 28 days old
  - Infants are ≤ 1 year old

- Normal blood pressure, delayed capillary refill, diminished peripheral pulses, and tachycardia indicates compensated shock in children.

- Hypotension and delayed capillary refill > 4 seconds indicates impending circulatory failure.

- Systolic blood pressure in children may not drop until the patient is 25-30% volume depleted. This may occur through dehydration, blood loss, or an increase in vascular capacity (e.g. anaphylaxis).

- Decompensated shock (hypotension with capillary refill > 5 seconds) may present as PEA in children.

- Sinus tachycardia is the most common cardiac rhythm in encountered in children.

- SVT should be suspected in the heart rate is greater than 180 in children ages (1-8) or greater than 220 in infants.

- Hypoglycemia may be found in pediatric shock, especially in infants.

- Pediatric shock victims are at risk for hypothermia due to their increased body surface area, exposure, and rapid administration of IV/IO fluids.
Contra Costa County Emergency Medical Services

**Newly Born**

### History
- Due date and gestational age
- Multiple gestation (twins, etc.)
- Meconium
- Delivery difficulties
- Congenital disease
- Medications (maternal)
- Maternal risk factors (substance abuse, smoking)

### Signs and Symptoms
- Just born
- Uncut umbilical cord
- Respiratory distress
- Peripheral cyanosis or mottling (normal)
- Central cyanosis or mottling (abnormal)
- Altered level of responsiveness
- Bradycardia

### Differential
- Airway failure (secretions, respiratory drive)
- Infection
- Maternal medication effect
- Hypovolemia
- Hypoglycemia
- Congenital heart disease
- Hypothermia

---

**Decision Tree**

#### Term gestation?  
- Breathing or crying?  
- Good muscle tone?

**Yes**
- **E** Provide warmth/dry infant
  - Clear airway if necessary
- Monitor and reassess

**No**
- **E** Warm, dry, and stimulate
  - Clear airway if necessary
  - Monitor and reassess

- **Heart rate > 100**
  - Warm, dry, and stimulate
  - Clear airway if necessary
  - Monitor and reassess

- **Heart rate < 100 or Labored breathing or persistent cyanosis**
  - **E** Supplemental oxygen
    - BVM ventilations
    - If repeating cycle, take correction action by changing BVM position or technique.
    - Maintain warmth
    - Cardiac monitor

- **Heart rate < 60**
  - **E** Supplemental oxygen
    - BVM ventilations
    - If repeating cycle, take correction action by changing BVM position or technique.
    - Maintain warmth
    - Begin chest compressions 3:1 ratio
    - Cardiac monitor
    - IV/IO procedure
    - **Epinephrine 1:10,000 IV/IO**
      - every 3-5 minutes as needed
      - Use Pediatape and refer to dosing guide
    - **Normal saline bolus**
      - Use Pediatape and refer to dosing guide

---

**AT ANY TIME**

- Return of spontaneous circulation
- **Go to Post Resuscitation TG**

---

**Notify receiving facility.**
- Contact Base Hospital for medical direction, as needed.
Pearls
- Most newborns requiring resuscitation will respond to ventilation/BVM, compressions, or Epinephrine. If not responding, consider hypovolemia, pneumothorax, or hypoglycemia (< 40mg/dl).
- Transport mother WITH infant whenever possible.
- Do not place hot packs directly on baby’s skin as it may cause severe burns.
- Common pediatric terms used to describe children are defined as:
  - Newly born are ≤ 24 hours old
  - Neonates are ≤ 28 days old
  - Infants are ≤ 1 year old
- Term gestation, strong cry/breathing and with good muscle tone generally will need no resuscitation.
- Most important vital signs in the newly born are respirations/respiratory effort and heart rate.
- Place baby skin-to-skin on mother.
- It is extremely important to keep an infant warm.
- Maternal sedation or narcotics will sedate an infant.
- Naloxone is no longer recommended for use in the newly born who may be sedated from maternal medications.
Pediatric Overdose/Toxic Ingestion

History
• Ingestion or suspected ingestion of a potentially toxic substance
• Substance ingested, route and quantity
• Time of ingestion
• Reason (suicidal, accidental or criminal)
• Available medications in home
• Past medical history and medications

Signs and Symptoms
• Mental status changes
• Hypo or hypertension
• Decreased respiratory rate
• Tachycardia or dysrhythmias
• Seizures
• S.L.U.D.G.E.

Differential
• Tricyclic antidepressants (TCAs)
• Acetaminophen (Tylenol)
• Aspirin
• Depressants
• Stimulants
• Anticholinergics
• Cardiac medications
• Solvents, alcohols or cleaning agents
• Insecticides (organophosphates)

Differential
• Tricyclic antidepressants (TCAs)
• Acetaminophen (Tylenol)
• Aspirin
• Depressants
• Stimulants
• Anticholinergics
• Cardiac medications
• Solvents, alcohols or cleaning agents
• Insecticides (organophosphates)

California Poison Control Center
(800) 222-1222
Advisory ONLY

Pearl
• Do not rely on patient history of ingestion, especially in suicide attempts. Make sure the patient is still not carrying other medications or weapons. Bring bottles, contents, and emesis to ED.

Treatment Guideline P09
Page 1 of 1

Effective Jan. 2020
**Pediatric Pain Control**

### History
- Age
- Location and duration
- Severity (0 – 10 scale or Wong-Baker faces scale)
- Past medical history
- Medications
- Drug allergies

### Signs and Symptoms
- Severity (pain scale)
- Quality (e.g., sharp, dull, or stabbing)
- Radiation
- Relation to movement or respiration
- Increased with palpation of area

### Differential
- Per the specific TG
- Musculoskeletal
- Visceral (abdominal)
- Cardiac
- Pleural / respiratory
- Neurogenic
- Renal (colic)

---

**Assess pain severity**
Use combination of pain scale, circumstances, MOI, injury, or illness severity

**Position of comfort**
- Apply cold pack, if applicable
- Monitor and reassess

**Consider IV/IO procedure**

**Assess and monitor respiratory status**
- Monitor continuous EtCO₂
- Apply and monitor cardiac rhythm

---

**Moderate to severe pain**

**Fentanyl IV/IO/IM**
- Use Pediatape and refer to dosing guide
- Use Pediatape and refer to dosing guide
- Single dose only
- Monitor and reassess every 5 minutes following administration

---

**Notify receiving facility.**
Contact Base Hospital for medical direction as needed

---

**Fentanyl**
- Contact Base Hospital for additional orders
Pearls

- Use EXTREME CAUTION in administering pain medication to patients less than 10kg.
- This treatment guideline applies to patients < 15 years of age and who can be measured on a PediaTape. If a patient is larger than a PediaTape, you may use the Adult Pain Control Treatment Guideline.
- Pain severity (0 – 10 scale or Wong-Baker faces scale) is a vital sign to be recorded before and after all BLS pain control measures and ALS pain medication delivery. Monitor blood pressure and respirations closely as pain control medications may cause hypotension or respiratory distress.
- Contraindications of Fentanyl include:
  - Closed head injury
  - Hypotension
    - Neonate: < 60mmHg or weak pulses
    - Infant: < 70mmHg or weak pulses
    - 1-10 years: < 70mmHg + (age in years x2)
    - Over 10 years: <90mmHg
  - Altered level of consciousness
  - Respiratory failure/worsening status
  - Headache
  - Childbirth/suspected active labor
  - Headache
- Have Naloxone available to reverse respiratory depression should it occur.
- Burn patients may require higher than usual opioid doses to achieve adequate pain control. IF A PATIENT HAS SUFFERED BURNS THAT REQUIRE TRANSPORT TO A BURN CENTER, THE PATIENT MAY REQUIRE MORE THAN THE MAXIMUM TOTAL DOSE OF FENTANYL TO ACHIEVE PAIN CONTROL. CONTACT THE BASE HOSPITAL FOR ADDITIONAL ORDERS.
Pediatric Respiratory Distress

History
- Time of onset
- Possibility of foreign body
- Past medical history
- Medications
- Fever/Illness
- Sick contacts
- History of trauma
- History/possibility of choking
- Ingestion/Overdose
- Congenital heart disease

Signs and Symptoms
- Wheezing/Stridor/Crackles/Rales
- Nasal flaring/Retractions/Grunting
- Increased heart rate
- AMS
- Anxiety
- Attentiveness/Distractibility
- Cyanosis
- Poor feeding
- JVD/Frothy sputum
- Hypotension

Differential
- Asthma/Reactive Airway Disease
- Aspiration
- Foreign body
- Upper or lower airway infection
- Congenital heart disease
- Overdose/Toxic ingestion/CHF
- Anaphylaxis
- Trauma

Airway patent, ventilation adequate, and oxygenation adequate?

- Yes
  - Allergic Reaction/Anaphylaxis?
    - Yes
      - Exit to Pediatric Allergic Reaction/Anaphylaxis TG
    - No
      - Cardiac monitor
      - Establish IV/IO, if indicated
      - EtCO₂ monitoring

- No
  - Mild
    - Albuterol Nebulizer 5mg
      - May repeat as needed
    - Monitor and re-assess
      - Monitor for worsening signs and symptoms
    - Notify receiving facility. Contact Base Hospital for medical direction, as needed.

- Severe
  - If no improvement and in severe distress
    - Epi 1:1,000 IM
    - Use Pediatape and refer to dosing guide
    - Albuterol Nebulizer 5mg
      - May repeat as needed

Pearls
- All patients with respiratory symptoms must have continuous pulse oximetry and EtCO₂ measurement.
- Do not force a child into a position; allow them to assume a position of comfort.
- Bronchiolitis is a viral infection typically affecting infants which results in wheezing which may not respond to Albuterol.
- Croup typically affects children > 2 years of age. It is viral, possible fever, gradual onset, and without drooling.
- Epiglottitis typically affects children > 2 years of age. It is bacterial patients with fever, rapid onset, and possible who want to sit up to keep airway open and drooling is common. Airway manipulation may worsen condition.
**Pediatric Seizure**

**History**
- Reported or witnessed seizure
- Previous seizure history
- Medical alert tag
- Seizure medications
- History of trauma
- History of diabetes
- History of pregnancy
- Time of seizure onset
- Document number of seizures
- Alcohol use, abuse, or abrupt cessation
- Fever

**Signs and Symptoms**
- Altered mental status
- Sleepiness
- Incontinence
- Observed seizure activity
- Evidence of trauma
- Unconscious
- Incontinence

**Differential**
- Head trauma
- Metabolic, hepatic or renal failure
- Tumor
- Hypoxia
- Electrolyte abnormality
- Drugs or medication non-compliance
- Infection or sepsis
- Alcohol withdrawal
- Eclampsia
- Stroke
- Hyperthermia
- Hypoglycemia

---

**Status Epileptus**
- 2 or more seizures in ≤ 5 minutes
- Any seizure lasting > 5 minutes

If duration cannot be confirmed, patient should be assumed to be in status if actively seizing when you arrived.

---

**Flowchart**

1. Ensure scene safety
2. Loosen any constrictive clothing
3. Assess and manage ABCs
4. Cardiac monitor
5. Status Epilepticus? (Confirmed or Suspected)
   - YES
   - Midazolam
     - IN (preferred) or IM
     - Use Pediatape and refer to dosing guide
     - Max dose:
       - 5 mg (≤ 40kg)
       - 10 mg (> 40kg)
   - NO
     - If febrile, initiate cooling measures
     - If BGL ≤ 60mg/dl, exit to Diabetic TG

6. Continues to seize?
   - YES
     - Consider additional Midazolam with base contact
   - NO
     - Check blood glucose
     - If BGL ≤ 60mg/dl, exit to Diabetic TG

7. Monitor and reassess
   - SMR if indicated
   - Manage any traumatic injuries

8. Notify receiving facility.
   - Contact Base Hospital for medical direction, as needed.
Pearls

- **Simple febrile seizures** are most common in ages 6 months to 5 years of age. They are, by definition, generalized seizures with no seizure history in the setting of any grade of fever, with an otherwise normal neurologic and physical exam. Any seizure confirmed to last for more than five (5) minutes should be treated with medication.

- Be prepared to assist ventilations, especially if Midazolam is used. Avoiding hypoxemia is extremely important.

- In an infant, a seizure may be the only evidence of a closed head injury.

- Status epilepticus is defined as two or more successive seizures without a period of consciousness or recovery OR seizures lasting greater than 5 minutes. This is a true emergency requiring rapid airway control, treatment and transport.

- Assess for the possibility of occult trauma and substance abuse, overdose, or ingestion/toxins.
Contra Costa County Emergency Medical Services

Pediatric Vomiting and Diarrhea

### History
- Age
- Time of last meal
- Last emesis/bowel movement
- Improvement or worsening with food or activity
- Duration of problem
- Other sick contacts
- Past medical history
- Past surgical history
- Medications
- Menstrual history (Pregnancy)
- Travel history
- Bloody emesis/diarrhea

### Signs and Symptoms
- Abdominal pain
- Character of pain (constant, intermittent, dull, sharp, etc.)
- Distension
- Constipation
- Diarrhea
- Anorexia
- Radiation

**Associated symptoms (helpful to localize source):**
- Fever, headache, blurred vision, weakness, malaise, myalgia, cough, dysuria, mental status changes, and rash

### Differential
- CNS (increased pressure, headache, stroke, CNS lesions, trauma or hemorrhage, vestibular)
- MI
- Drugs (NSAIDs, antibiotics, narcotics, chemotherapy)
- GI or renal disorders
- Diabetic ketoacidosis
- Gynecologic disease (ovarian cyst, PID)
- Infections (pneumonia, influenza)
- Electrolyte abnormalities
- Food or toxin induced
- Medication or substance abuse
- Pregnancy
- Psychological

### Treatment Algorithm

- **Nausea or vomiting**
  - **Yes**: Ondansetron IV/IO/IM/ODT
    - Use Pediatape and refer to dosing guide
    - May repeat x1 in 15 minutes for patients > 40kg
  - **No**:
    - Exit to Hypotension/Shock TG as indicated
    - Improving

- **Normal saline bolus**
  - Use Pediatape and refer to dosing guide
  - Establish IV/IO
  - Cardiac monitor

- **Serious sign/symptoms**
  - Hypotension, poor perfusion, shock
  - Yes
  - No

- **Blood glucose analysis**
  - Yes: Diabetic TG as indicated
  - No: Exit to Hypotension/Shock TG as indicated

- **Notify receiving facility. Contact Base Hospital for medical direction, as needed.**

### Pearls
- Heart rate: One of the first clinical signs of dehydration is almost always an increased heart rate. Tachycardia increases as dehydration becomes more severe, very unlikely to be significantly dehydrated if heart rate is close to normal.
- Beware of only vomiting (without diarrhea) in children. Pyloric stenosis, bowel obstruction, and CNS processes (bleeding, tumors, or increased CSF pressures) all often present with isolated vomiting.
- Ondansetron is not indicated for motion sickness.
This page intentionally left blank
**Trauma Triage**

**ACTIVATION**

- **Unmanageable airway or Traumatic arrest not meeting field determination**
  - No
  - Yes

**Measure vital signs and level of consciousness**

1. GCS ≤ 13
2. Systolic blood pressure < 90mmHg
3. Adult respiratory rate < 10 or > 29 or need for ventilatory support
4. Infant (< 1 year of age) respiratory rate < 20

**Assess anatomy of injury**

1. All penetrating injuries to head, neck, torso, groin, pelvis, buttocks, and extremities above the elbow or knee
2. Chest wall instability or deformity (e.g. flail chest)
3. Two or more proximal long bone fractures
4. Crushed, degloved, mangled, or pulseless extremity
5. Amputation above the wrist or ankle
6. Pelvic instability

**Assess mechanism of injury and evidence of high-energy impact**

1. Adult fall > 20 feet
2. Pediatric fall > 10 feet or 2-3 times height of child
3. High risk auto crash with > 12 inches intrusion on patient side or > 18 inches at any site of passenger compartment
4. Ejection (partial or complete)
5. Death in same passenger compartment
6. Auto vs. pedestrian/bicyclist thrown, run over or with significant impact > 20mph
7. Any unenclosed vehicle crash > 20mph (e.g. motorcycle, bicycle, ATV, etc.)

**Meets Destination / Call-in Criteria?**

- Yes
- No

**Closest facility**

**Trauma Center transport with early notification**
### Risk Factor Advisory

Patients with either high energy or low energy mechanisms are more prone to serious injury if they have one or more of the following risk factors:

- Pregnancy over 20 weeks
- Communication barrier (e.g., age, language, psychiatric, or developmental issues)
- Age 55 or older
- Patient taking anticoagulants or with known bleeding disorder

<table>
<thead>
<tr>
<th>High energy mechanism</th>
<th>Low energy mechanism</th>
</tr>
</thead>
<tbody>
<tr>
<td>Motor vehicle crash</td>
<td>Low energy mechanisms should merit Base Hospital contact if symptoms, physical findings, or concern are encountered</td>
</tr>
<tr>
<td>Estimated impact speed of &gt; 40mph</td>
<td></td>
</tr>
<tr>
<td>Mechanical extrication required by fire department personnel</td>
<td></td>
</tr>
<tr>
<td>Rollover with unrestrained occupant</td>
<td></td>
</tr>
</tbody>
</table>

Person struck by a vehicle at < 20mph

Person ejected /fell from other object (e.g., motorcycle, horse, or ATV)

Blunt assault with weapon (e.g., pipe, bat, or golf club)

Falls > 10 but < 20 feet

*This list is not all-inclusive and other high energy mechanisms encountered also merit Base Hospital contact*

**Consider Base Hospital contact for destination**

For situations not described above, consider Base Hospital contact if paramedic has concern that a serious injury may exist.

**Effective Jan. 2020**
Pearls
• Do not let alcohol confuse the clinical picture. Alcoholics may have unrecognized injuries, particularly head bleeds.
• A complete hands on head-to-toe assessment is required for all trauma patients.
• Transport should be initiated within 10 minutes of ambulance arrival unless patient requires extrication.

Age Categories
- Adult Patient – Trauma patients 15 years of age and older.
- Pediatric Patients – Trauma patients under the age of 15 years.

Trauma Receiving Facilities
- Adult Trauma Centers – John Muir Medical Center – Walnut Creek is the designated trauma center for adults in Contra Costa County. In some circumstances, patients may be transported to other trauma receiving facilities. Alameda County Medical Center (Highland) and Eden Medical Center are trauma receiving facilities that, when they are the closest trauma receiving facility, may be appropriate for ground transport of trauma patients.
- Pediatric Trauma Centers – UCSF Benioff Children’s Hospital of Oakland (CHO) is the most appropriate destination for the majority of pediatric trauma patients.
  - John Muir Medical Center – Walnut Creek may be an appropriate trauma receiving facility for critically injured pediatric trauma patients who are near arrest or have a very prolonged transport time. UC Davis Medical Center is also a pediatric trauma receiving facility and may be utilized when helicopter transport is involved.

Receiving Facilities – Local hospitals that are not trauma receiving facilities are destinations for patients who are triaged by the Base Hospital at the time of report as not requiring trauma center care. A trauma receiving facility may also serve as the receiving facility when it is the patient’s facility of choice.

Low Energy Mechanism Trauma
- Low energy mechanism trauma may reveal significant trauma. Examples include, but are not limited to ground level or short falls, blunt assault without a weapon (e.g. closed fist), low speed motor vehicle crash, or other blunt trauma (e.g. sports injury). Symptoms or concern may include:
  - Symptoms in the presence of head injury such as headache, vomiting, loss of consciousness, repetitive questioning, abnormal, or combative behavior or new onset of confusion
  - Pain level greater than 5/10 related to head, neck, or torso injury
  - Any concerns due to hypotension, tachycardia, or tachypnea
  - Systolic BP < 110mmHg in patients 65 years of age or older
  - Torso injury with tenderness of abdomen, chest/ribs or back/flank
  - Suspected hip dislocation or pelvis injury

Other Definitions
- Unmanageable Airway – A patient whose airway is unable to be adequately maintained with BLS or ALS maneuvers. Adult trauma patients are candidates for immediate redirection to the trauma center following airway stabilization at a non-trauma receiving facility.
- Traumatic Arrest – Patients who do not qualify for field determination of death but have or develop cardiopulmonary arrest should be transported to the closest Basic ED by ground ambulance.

Exceptions:
- Patients with penetrating trauma who arrest (pulseless, apneic, or pulseless with agonal respirations) after the arrival of transport personnel should be immediately transported to a trauma center if transport time is 20 minutes or less to that facility. If no Trauma Center is available within 20 minutes, patients should be transported to the closest basic emergency department.
- If a helicopter crew is present at the time of arrest (blunt or penetrating) and the air transport can be initiated immediately, use of helicopter to transport to a trauma center is appropriate.
Contra Costa County Emergency Medical Services

Bites and Envenomation

History
- Type of bite or sting
- Description or photo of creature for identification, if safe to do so
- Time, location, size of bite or sting
- Previous reaction to bite or sting
- Domestic vs. wild
- Tetanus and Rabies risk
- Immunocompromised patient

Signs and Symptoms
- Rash, skin break, or wound
- Pain, soft tissue swelling, or redness
- Blood oozing from the bite wound
- Evidence of infection
- Shortness of breath or wheezing
- Allergic reaction, hives, or itching
- Hypotension or shock

Differential
- Animal bite
- Human bite
- Snake bite (poisonous)
- Spider bite (poisonous)
- Insect sting/bite (bee, wasp, ant, or tick)
- Infection risk
- Rabies risk
- Tetanus risk

If needed
California Poison Control
(800) 222-1222

General wound care
Consider, IV/IO

Allergic reaction/
Anaphylaxis
Yes
Allergic Reaction/
Anaphylaxis TG
No

Serious injury or
hypotension
Yes
Hypotension/Shock TG
Trauma TG
No

Moderate/severe
Pain
Yes
Appropriate pain
control

Identification of animal,
if possible

Spider bite

Bee/wasp sting

Immobilize injury

Elevate wound location to a neutral position, if able
Consider, applying cold pack(s)
Remove any constricting clothing/bands/jewelry

Snake bite

Immobilize injury

Elevate wound location to a neutral position, if able
Remove any constricting clothing/bands/jewelry
DO NOT apply COLD PACKS
Remove all jewelry from affected extremity
Mark margin of swelling/redness and time

Dog / cat

Human bite

Immobilize injury

Extremity trauma TG
if indicated

Transport
No

Yes

Animal bites: Contact and document contact with Animal Control or Law Enforcement Officer

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.

Effective Jan. 2020
Pearls

- Human bites have higher infection rates than animal bites due to normally occurring mouth bacteria.
- Carnivore bites are much more likely to become infected and may have risk of Rabies exposure.
- Cat bites may progress to infection rapidly due to a specific bacteria (Pasteurella multicauda).
- Poisonous snakes in our region are generally of the pit viper family: six rattlesnake species.
- If no pain or swelling is present, envenomation is unlikely. About 25% of snake bites are dry bites.
- Black Widow spider bites tend to be minimally painful initially, but over a few hours, muscular and severe abdominal pain may develop (black spider with a red hourglass on belly).
- Brown Recluse spider bites are minimally painful to painless. Little reaction is noted initially but tissue necrosis at the site of the bite develops over the next few days (brown spider with fiddle shape on back).
- Evidence of infection includes: swelling, redness, drainage, fever, and red streaks proximal to wound.
- Immunocompromised patients are at an increased risk for infection.
- Consider contacting the California Poison Control Center for identification (800) 222-1222.
Contra Costa County Emergency Medical Services

Bums

History
- Type of exposure (heat, gas or chemical)
- Inhalation injury
- Time of injury
- Other trauma
- Past medical history
- Medications

Signs and Symptoms
- Burns, pain, or swelling
- Dizziness
- Loss of consciousness
- Hypotension/shock
- Airway compromise or distress could be presented as hoarseness or wheezing

Differential
- Superficial – red and painful (do not include in TBSA)
- Partial thickness – blistering
- Full thickness – painless with charred or leathery skin
- Chemical injury
- Thermal injury
- Radiation injury
- Blast injury

Assess burn injury severity

Minor
- < 20% TBSA partial or full thickness burns
- No inhalation injury
- GCS > 13

E
- Remove rings, bracelets, and constricting items
P
- Apply clean dressing to burn area

Consider IV
Cardiac monitor

Trauma Triage TG if indicated
Pain Control TG if indicated

Transport to facility of choice. Consider transporting to Burn Center for burns to the face, hands, perineum, or feet and circumferential burns

Major
- ≥ 20% TBSA partial or full thickness burns
- Burns with suspected inhalation injury or high voltage electrical burns

E
- Remove rings, bracelets, and constricting items
P
- Apply clean dressing to burn area

Maintain airway
Consider, one 20g or larger IV in each AC
Cardiac monitor
EtCO₂ monitoring

Trauma Triage TG if indicated
Pain Control TG if indicated

Transport to appropriate facility
Burns with trauma to Trauma Center Burns only to Burn Center

Notify receiving facility. Contact Base Hospital for medical direction, as needed.

Approved Burn Receiving Centers
St. Francis – San Francisco
Valley Med. Center – San Jose
UC Davis – Sacramento

Cardiac monitor
EtCO₂ monitoring
Cardiac monitor

Treatment Guideline T03
Page 1 of 2
Effective Jan. 2020

Contra Costa County Emergency Medical Services

Bums

Pearls

- Airway burns may lead to rapid compromise of the airway and can be identified by soot around the nares or mouth or visible burns or edematous mucosa in the mouth.
- Early intubation is required when the patient experiences significant inhalation injuries. If the patient requires advanced airway management that cannot be quickly achieved in the field, transport to the nearest facility for stabilization prior to transfer to the Burn Center. Do not wait for a helicopter if airway patency is a critical concern.
- For major burns, do not apply wet dressings, liquids or gels to burns unless it is to remove whatever caused the burn (i.e. dry chemical agent, etc.). Cooling large burns may lead to hypothermia.
- Burn patients are often trauma patients. If burns are evident in the presence of trauma, follow trauma triage guidelines and transport to trauma center if activation criteria is met. Do not transport a trauma patient with burns to a burn center.
- Circumferential burns to extremities are dangerous due to potential vascular compromise secondary to soft tissue swelling.
- Never administer IM pain medication into a burned area.

Rule of Nines

- Seldom will you find a complete isolated body part that is injured as described in the Rule of Nines. More likely, it will be portions of one area, portions of another, and an approximation will be needed.
- For the purpose of determining the extent of serious injury, differentiate the area with minimal (superficial) burn from those of partial or full thickness burns.
- When calculating TBSA of burns, include only partial and full thickness burns; do not include superficial burns in the calculation.

Burn Assessment Terminology

<table>
<thead>
<tr>
<th>Approved Terminology</th>
<th>Former Terminology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Superficial</td>
<td>1st degree</td>
</tr>
<tr>
<td>Partial thickness</td>
<td>2nd degree</td>
</tr>
<tr>
<td>Full thickness</td>
<td>3rd degree</td>
</tr>
</tbody>
</table>

Burn assessment should be documented and reported using only approved terminology.

© copyright 2003 Regents of the University of Michigan
Extremity Trauma

**History**
- Type and time of injury
- Mechanism (crush, penetrating, blunt, or amputation)
- Open vs. closed wound/fracture
- Past medical history
- Medications

**Signs and Symptoms**
- Evidence of trauma
- Pain, swelling, deformity, or bleeding
- Altered sensation or motor function
- Diminished pulse or capillary refill
- Decreased extremity temperature

**Differential**
- Abrasion
- Contusion
- Laceration
- Sprain
- Dislocation
- Fracture
- Amputation

---

Control hemorrhaging
Apply tourniquet for hemorrhage or shock
- Consider Hemostatic Gauze
- Place splints and cold packs to stabilize fractures as necessary

**E** Establish IV/IO
Cardiac monitor
- If SBP < 90 in adults
  - Normal Saline bolus 500ml IV/IO
  - Reassess patient for criteria above
  - May repeat to a Maximum 1L as long as criteria above exists
- If poor perfusion or shock in peds
  - Normal Saline bolus IV/IO
  - Use PEDIATAPE and refer to dosing guide
  - Repeat to age dependent goal SBP
  - May repeat to a Maximum 1L as long as criteria above exists

In the absence of head trauma, age-specific hypotension, poor perfusion or AMS
- Consider pain control

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.

---

Crush injury?

Yes

Early transport after release
Limit scene time to 10 minutes
Secure airway and support respiratory rate
Place splints and cold packs to stabilize fractures as necessary
Control hemorrhaging
Apply tourniquet for hemorrhage or shock
- Consider Hemostatic Gauze
- Establish IV/IO
- Cardiac monitor
- EtCO₂ monitoring

If SBP < 90 in adults
- Normal Saline bolus 500ml IV/IO
  - Reassess patient for criteria above
  - May repeat as long as criteria above exists

If poor perfusion or shock in peds
- Normal Saline bolus IV/IO
  - Use PEDIATAPE and refer to dosing guide
  - Repeat to age dependent goal SBP
  - May repeat as long as criteria above exists

In the absence of head trauma, age-specific hypotension, poor perfusion or AMS
- Consider pain control

Prior to release from entanglement
- Albuterol nebulizer 5mg in 6ml Normal Saline
  - For suspected hyperkalemia:
    - Peaked T-waves; or
    - QRS > 0.12 seconds; or
    - Loss of P-waves
  - Albuterol nebulizer 5mg in 6ml Normal Saline
  - Calcium Chloride 1gm over 60 seconds
  - 20ml flush IV/IO prior to pushing next med
  - Sodium Bicarbonate 1mEq/kg

No

Exit to Airway TG
if indicated

Exit to Pain Control TG
if indicated

---

Tourniquet use should not be delayed until a patient is in shock or is clearly exsanguinating. It should be applied early and can be used safely without risk of patient injury. Do not wait; apply often and tighten if needed.

---

**Effective Jan. 2021**
Pears

- For partial amputations, splint affected extremity in anatomic location and elevate extremity.
- For complete amputations, place amputated part in a dry container or bag and place on ice. Seal or tie off bag and place in second container or bag. DO NOT place amputated extremity directly on ice or in water. Elevate extremity and dress with dry gauze.
- Penetrating trauma to an extremity may hide significant vascular injury and hemorrhage. Early application of a tourniquet should be considered.
- In cases of clear-cut traumatic arrest, epinephrine is not indicated in PEA or asystole. Epinephrine will not correct arrest caused by a tension pneumothorax, cardiac tamponade, or hemorrhagic shock. If there is any doubt as to the cause of arrest, treat as a non-traumatic arrest.
- Hypotension is age dependent. This is not always reliable and should be interpreted in context with the patient’s typical BP, if known. Shock may be present with a seemingly normal blood pressure initially.
  - Neonate: < 60mmHg or weak pulses
  - Infant: < 70mmHg or weak pulses
  - 1-10 years: < 70mmHg + (age in years x2)
  - Over 10 years: <90mmHg
  - Over 65 years: <110mmHg
- If vigorous hemorrhage is not controlled with elevation and direct pressure on wound, apply a tourniquet. Tourniquets may be used in pediatric patients.
- Tourniquets and hemostatic gauze may also be appropriate for hemorrhage control in multi-casualty incidents.
- Consider the use of hemostatic gauze to pack the wound. More than hemostatic agent may be needed. Secure hemostatic gauze in place with a compression bandage.
- Crush Injury Syndrome is caused by muscle crush injury and cell death. Most patients have an extensive area of involvement such as a large muscle mass in a lower extremity or the pelvis. May develop after one (1) hour in the presence of a severe crush, but usually requires at least four (4) hours of compression. Hypovolemia and hyperkalemia may occur, particularly in extended entrapments.
- Avoid hyperventilation. Maintain an EtCO₂ of 35 or greater, which may be unreliable if the patient was subject to multisystem trauma or poor perfusion.
- Hypotension usually indicates injury or shock and should be treated aggressively.
- An important item to monitor and document is a change in the level of consciousness by repeat examination.
- Do not overlook the possibility of associated domestic violence or abuse.
History
- Time of injury
- Mechanism (blunt vs. penetrating)
- Loss of consciousness
- Bleeding
- Past medical history
- Medications (anticoagulants)

Signs and Symptoms
- Evidence of trauma
- Pain, swelling, or bleeding
- AMS
- Unconscious
- Respiratory distress or failure
- Vomiting
- Seizure

Differential
- Skull fracture
- Spinal injury
- Abuse

Spinal Motion Restriction if indicated
- Secure airway and support respiratory rate
- Elevate head 30 degrees unless contraindicated.
- Position patient on left side if needed for vomiting

Hemorrhage Control
- Direct Pressure
- Pressure Bandage
- Consider Hemostatic Gauze

Establish IV/IO
Cardiac monitor
EtCO₂ monitoring

Potentially Severe Head Injury?
- Any one of these:
  - LOC at any point
  - GCS ≤ 14
  - Any post-traumatic seizure
  - Multisystem trauma requiring intubation?

For Nausea/Vomiting Consider
Adults - Ondansetron 4mg IV/IO/IM/ODT
(May repeat every 10 minutes to a Maximum 12mg)

Pediatric ≥ 4 years - Ondansetron IV/IO/IM/ODT
Use PEDIATAPE and refer to PEARLS
guide (May repeat x1 for ped’s > 40kg)

Notify receiving facility. Contact Base Hospital for medical direction, as needed.

Limit Scene Time – Transport Early
- High flow O₂ via NRB
- Maintain SPO₂ as close to 100% as possible
- If unable to maintain SPO₂ with NRB & BLS maneuvers – Proceed with BVM
- AVOID HYPERVENTILATION

If SBP approaching 90 or rapidly dropping in adults
- Normal Saline bolus 1000ml IV/IO
- Reassess patient for criteria above
- May give additional 500ml IV/IO as long as criteria above exists

If poor perfusion or shock in peds
- Normal Saline bolus IV/IO
- Use PEDIATAPE and refer to PEARLS
- Repeat to age dependent goal SBP
- May repeat to a Maximum 1L as long as criteria above exists

Age Dependent Signs of Shock
- Neonate: < 60mmHg or weak pulses
- Infant: < 70mmHg or weak pulses
- 1-10 years: < 70mmHg + (age in years x2)
- Over 10 years: <90mmHg
- Over 65 years: <110mmHg
**Head Trauma**

**Increased Intracranial Pressure**

**Changes in LOC**
- Papilledema
- Impaired eye movement
- ↓ sensory/motor function

**Infants**
- Bulging fontanels
- Cranial suture separation
- ↑ head circumference
- High-pitched cry

**Cushing’s Triad**
- Altered breathing
- Slow pulse
- Increased BP

**Pain in**
- Headache
- Pupillary changes
- Vomiting
- Changes in vital signs
- ↑ Blood pressure
- ↓ Pulse
- Changes in respiratory pattern

**Pears**
- Aggressively prevent and treat the **“Three H-Bombs” of TBI:**
  - Hypoxemia: Early signs include confusion and restlessness.
  - Hypotension: Usually indicates injury or shock unrelated to head injury and should be treated aggressively.
  - Hyperventilation: Causes vasoconstriction which can lead to decreased blood supply.

- All potential TBI patients should receive continuous oxygen via NRM. Threshold > 90% O2 saturation with optimal 92-98% readings.

- Basic airway management is preferred unless unable to effectively manage with BLS maneuvers. Utilize jaw thrust technique to open the airway. Do not delay scene time to intubate.

- If patient shows any sign of inadequate oxygenation, ventilate using BVM. Use of two-finger bag valve technique is critical. Ventilation rates:
  - Adults 15+: 10 BPM
  - Peds 2-14: 20 BPM
  - Infants: 25 BPM

- IV Crystalloids if SBP approaching 90 or dropping rapidly in average adult.

- Hypotension is age dependent. This is not always reliable and should be interpreted in context with patients normal BP, if known. Shock may be present with a seemingly normal blood pressure:
  - Neonate: < 60 mmHg or weak pulses
  - Infant: < 70 mmHg or weak pulses
  - 1-10 years: < 70 + (age in years x 2)
  - Over 10 years: < 90 mmHg
  - Over 65 years: < 110 mmHg

- Target ETCO2 of 40 (range 35-45). ETCO2 may be unreliable if the patient was subject to multisystem trauma or poor perfusion.

- Initial documentation of GCS is a vital step in the assessment process. Aggressively monitor and document for changes by repeat examination.

- Perform modest hyperventilation to maintain an ETCO2 of 30-35 for significant signs of increased intracranial pressure or signs of brainstem herniation (dilated pupil on one side or posturing).

- In cases of traumatic arrest, the use of Epi is not indicated.

- Scalp hemorrhage can be life threatening. Treat with direct pressure and pressure dressing. If bleeding is not controlled apply hemostatic agent topically.

- Consider possibility of domestic violence or abuse.
**History**
- Time of injury
- Mechanism (blunt vs. penetrating)
- Damage to structure or vehicle
- Location of patient in structure or vehicle
- Restraints or protective equipment use
- Past medical history
- Medications

**Signs and Symptoms**
- Evidence of trauma
- Pain, swelling, deformity, lesions, or bleeding
- AMS
- Unconscious
- Respiratory distress or failure
- Hypotension or shock
- Arrest

**Differential**
- Chest:
  - Tension pneumothorax
  - Flail chest
  - Pericardial tamponade
  - Open chest wound
  - Hemorrhax
- Intra-abdominal bleeding
- Pelvis or femur fracture
- Spinal injury
- Head injury
- Hypothermia

---

**Early transport**
Limit scene time to 10 minutes

- Spinal Motion Restriction
  - *If indicated*
- Secure airway and support respiratory rate
- Place splints and cold packs to stabilize fractures as necessary
- Control hemorrhage
  - *Do not delay transport*
- Establish IV/IO
- Cardiac monitor
- EtCO₂ monitoring
- Needle Thoracostomy
  - *If indicated*

If SBP < 90 in adults
- Normal Saline bolus 500ml IV/IO
- Reassess patient for criteria above
- May repeat to a Maximum 1L as long as criteria above exists

If poor perfusion or shock in peds
- Normal Saline bolus IV/IO
- Use PEDIATAPE and refer to dosing guide
- Repeat to age dependent goal SBP
- May repeat to a Maximum 1L as long as criteria above exists

In the absence of head trauma, age-specific hypotension, poor perfusion or AMS

**Exit to Airway TG if indicated**

**Notify receiving facility.**
Contact Base Hospital for medical direction, as needed.
Pears

- ALS procedures in the field do not significantly improve patient outcome in critical trauma patients.
- Basic airway management is preferred unless unable to effectively manage with BLS maneuvers. Utilize jaw thrust technique to open the airway.
- Intubation of head injury patients is best addressed at the hospital. Advanced Airways should not be used in traumatic arrest.
- In cases of clear-cut traumatic arrest, epinephrine is not indicated in PEA or asystole. Epinephrine will not correct arrest caused by a tension pneumothorax, cardiac tamponade, or hemorrhagic shock. If there is any doubt as to the cause of arrest, treat as a non-traumatic arrest.
- Hypotension is age dependent. This is not always reliable and should be interpreted in context with the patient’s typical BP, if known. Shock may be present with a seemingly normal blood pressure initially.
  - Neonate: < 60mmHg or weak pulses
  - Infant: < 70mmHg or weak pulses
  - 1-10 years: < 70mmHg + (age in years x2)
  - Over 10 years: < 90mmHg
  - Over 65 years: < 110mmHg
- Avoid hyperventilation. Maintain an EtCO₂ of 35 or greater, which may be unreliable if the patient was subject to multisystem trauma or poor perfusion.
- Hypotension usually indicates injury or shock and should be treated aggressively.
- An important item to monitor and document is a change in the level of consciousness by repeat examination.
- Do not overlook the possibility of associated domestic violence or abuse.
Contra Costa County Emergency Medical Services

Heat Illness/Hyperthermia

History
- Exposure to increased temperatures, humidity, or extreme physical exertion
- Time and length of exposure
- Fatigue or muscle cramping
- Poor oral intake of fluids
- Past medical history
- Medications

Signs and Symptoms
- AMS
- Hot, dry, or sweaty skin
- Hypotension or shock
- Seizures
- Nausea

Differential
- Fever
- Dehydration
- Delirium tremens (DTs)
- Heat cramps
- Heat exhaustion
- Heat stroke

Pearls
- Check an initial temperature and repeat every 15 minutes while actively cooling.
- Extremes of age are more prone to heat emergencies. Obtain and document the patient temperature and location taken.
- Salicylates and some recreational drugs may elevate body temperature.
- Sweating generally disappears as body temperature rises above 104°F.
- Intense shivering may occur as a patient is cooled.
- Seizures may occur with heat stroke; treat seizures per seizure treatment guideline.
- Increasing symptoms merit more aggressive cooling measures. With mild symptoms of heat exhaustion, movement to a cooler environment and fanning may suffice.

Notify receiving facility.
Contact Base Hospital for medical direction, as needed.

**Contra Costa County Emergency Medical Services**

**Hypothermia**

**History**
- Age
- Exposure to decreased temperatures, but may occur in normal atmospheric temperatures
- Time and length of exposure
- Drug or alcohol use
- Infection or sepsis
- Past medical history
- Medications

**Signs and Symptoms**
- AMS
- Cold or clammy skins
- Shivering
- Extremity pain or sensory abnormality
- Bradycardia
- Hypotension or shock

**Differential**
- Sepsis
- Environmental exposure
- Hypoglycemia
- CNS dysfunction
- Stroke
- Head injury
- Spinal cord injury

**Pearls**
- Severe hypothermia may cause cardiac instability. Avoidance of excess stimuli is important in severe hypothermia as the heart is sensitive and interventions may induce arrhythmias. Necessary interventions should be done as gently as possible.
- Check for pulselessness for 30-45 seconds to avoid unnecessary chest compressions.
- Defer ACLS medications until patient is warmed.
- If V-Fib or pulseless V-Tach is present, shock x1, and defer further shocks.
- Extremes of age, malnutrition, alcohol, and other drug use are contributing factors to hypothermia.
- Patients with prolonged hypoglycemia often become hypothermic; blood glucose analysis is essential.
- If a temperature is unable to be measured, treat the patient based on the suspected temperature.
- Warm packs can be placed in the armpit and groin areas. Care should be taken not to place directly on skin.

---

**Treatment Guideline T08**

**Page 1 of 1**

**Effective Jan. 2020**
This page intentionally left blank
Clinical Indications:
1. Suspected cardiac patient or suspected stroke patient.
2. As required by treatment guidelines.

Procedure:
1. Prepare ECG monitor and connect patient cable with electrodes.
2. Enter the required patient information (e.g. patient name, age and gender) into the ECG monitor.
3. Expose chest and prep as necessary (e.g. shaving). Modesty of the patient should be respected.
4. Apply chest leads and extremity leads using the following landmarks:
   a. V1 – 4th intercostal space at right sternal border
   b. V2 – 4th intercostal space at left sternal border
   c. V3 – Directly between V2 and V4
   d. V4 – 5th intercostal space at midclavicular line
   e. V5 – Level with V4 at left anterior axillary line
   f. V6 – Level with V5 at left midaxillary line
5. Instruct the patient to remain still.
6. Acquire the 12-Lead ECG.
7. If the monitor detects signal noise (such as patient motion or a disconnected electrode), the 12-Lead acquisition may be interrupted until the noise is resolved.
8. Once acquired, transmit any 12-Lead ECG that indicates the patient is having a STEMI to the appropriate receiving STEMI Center.
9. Contact the receiving STEMI Center to notify them that a positive 12-Lead ECG has been sent.
10. Monitor the patient while continuing with the treatment protocol.
11. Download the cardiac monitor data as required by EMS policy and attach a copy of the 12-Lead ECG to the prehospital EHR.
12. Document the procedure, time, and results in the prehospital EHR.

Contra Costa County Emergency Medical Services
12-Lead ECG

Field Procedure FP01
Page 1 of 1
Clinical Indications:

1. A patient who is unable to maintain their airway without assistance.

Procedure:

1. Position the patient to optimize airway opening and facilitate ventilations.
   a. Use the sniffing position with head extended (A) and neck flexed forward (B) unless there is a suspected spinal injury.
   b. Position with head/shoulders elevated; anterior ear should be at the same horizontal level as the sternal notch (C). This is especially advantageous in larger or morbidly obese patients.

2. Using a two-person technique is the preferred method to ventilate patients with a Bag-Valve-Mask (BVM).
   a. J – jaw thrust maneuver to open the airway.
   b. A – use a nasal or oral airway. Appropriately measure before placing airway adjunct.
   c. W – work together to ventilate the patient using a BVM. This should be done using two rescuers – one holding the mask to achieve an optimal seal and the other to deliver ventilations.
   d. S – slow and small ventilations to produce visible chest rise.

3. It is required that the airway be monitored continuously through waveform capnography (ALS providers) and pulse oximetry.

Notes:

1. The goal of airway management is to ensure adequate ventilation and oxygenation. Initial airway management should always begin with BLS maneuvers.
2. Avoid excessive ventilation. In non-arrest patients, ventilation rates should be:
   a. Adults – 10/minute
   b. Children – 20/minute
   c. Infants – 30/minute
Clinical Indications:
1. Patients meet clinical indications for oral intubation.

Contraindications:
1. Two attempts at intubation.
2. Age less than eight (8) or ETT size less than 6.5 mm.

Procedure:
1. Prepare, position, and oxygenate the patient with 100% oxygen.
2. Select the proper ET tube and remove stylette; test cuff and prepare suction.
3. Lubricate the distal end and cuff of the endotracheal tube (ETT) with a water-based lubricant and the distal 1/2 of the Bougie device. (Note: Failure to lubricate the Bougie and the ETT may result in being unable to pass the ETT).
4. Using the laryngoscope, visualize the vocal cords, if possible, using the BURP maneuver as needed.
5. Introduce the Bougie with the curved tip anteriorly and visualize the tip passing the vocal cords or above the arytenoids if the cords cannot be visualized.
6. Once inserted, gently advance the Bougie until you meet resistance; feel for the tracheal rings. If you do not meet resistance, you have a probable esophageal intubation and insertion should be reattempted or use a i-Gel.
7. Withdraw the Bougie ONLY to a depth sufficient to allow loading of the ETT while maintaining proximal control of the Bougie.
8. Gently advance the Bougie and loaded ETT until you have feel resistance again, thereby assuring tracheal placement and minimizing the risk of accidental displacement of the Bougie.
9. While maintaining a firm grasp on the proximal Bougie, introduce the ETT over the Bougie passing the tube to its appropriate depth.
10. If you are unable to advance the ETT into the trachea and the Bougie and ETT are adequately lubricated, withdraw the ETT slightly and rotate the ETT 90 degrees COUNTER clockwise to turn the bevel of the ETT posteriorly. If this technique fails to facilitate passing of the ETT you may attempt direct laryngoscopy while advancing the ETT (this will require an assistant to maintain the position of the Bougie and, if so desired, advance the ETT).
11. Once the ETT is correctly placed, hold the ETT securely and remove the Bougie.
12. Confirm tracheal placement according to the intubation protocol, inflate the cuff with 3 – 10cc of air, auscultate for equal breath sounds, and reposition accordingly.
13. When final position is determined secure the ETT, reassess breath sounds, apply EtCO₂ monitoring, and record and monitor readings to assure continued tracheal intubation.
Clinical Indications:

1. Inability to adequately ventilate a patient with a Bag Valve Mask (BVM) and basic airway adjunct.
2. An unconscious patient without a gag reflex who is apneic or is demonstrating inadequate respiratory effort.

Procedure:

1. Using the Cormack Lehane difficult airway assessment tool to determine if the patient’s airway will be difficult to intubate. If it is determined to be difficult, use an i-Gel.
2. Prepare, position, and oxygenate the patient with 100% Oxygen.
3. Select proper ET tube and stylette; have suction ready.
4. The use of a Bougie device is strongly encouraged with all ET intubation attempts.
5. Using laryngoscope, visualize vocal cords. (Use the BURP maneuver to assist).
6. Limit each intubation attempt to 30 seconds with BVM between attempts.
7. Visualize tube passing through vocal cords.
8. **Confirm and document tube placement using an EtCO₂ monitoring.**
9. Inflate the cuff with 3 – 10cc of air; secure the tube using a commercial tube holder.
10. Auscultate for bilaterally equal breath sounds and absence of sounds over the epigastrium. If you are unsure of placement, remove tube and ventilate patient with a BVM.
11. Apply waveform capnography. After 3 ventilations, EtCO₂ should be >10 or comparable to pre-intubation values. If < 10, check for adequate circulation, equipment, and ventilatory rate. If EtCO₂ remains < 10 without physiologic explanation, remove the ETT and ventilate using an airway adjunct and BVM.
12. Consider using an i-Gel if intubation efforts are unsuccessful.
13. Monitor EtCO₂ and record readings on scene, en route to the hospital, and at the hospital.
14. Document ETT size, time, result (success) and placement location by the centimeter marks either at the patient’s teeth or lips in the EHR. Document all devices used to confirm initial tube placement. Also document positive or negative breath sounds before and after each movement of the patient.
15. **It is required that the airway be monitored continuously through waveform capnography (ALS providers) and pulse oximetry.**
Clinical Indications:

1. Sudden onset of respiratory distress often with coughing, wheezing, gagging, or stridor due to a foreign-body obstruction of the upper airway.

Procedure:

1. Assess the degree of foreign body obstruction.
   a. Do not interfere with a mild obstruction; allow the patient to clear their airway by coughing.
   b. In severe foreign-body obstructions, the patient may not be able to make a sound. The patient may clutch his/her neck demonstrating the universal choking sign.

2. **For an infant**, deliver 5 back blows (slaps) followed by 5 chest thrusts repeatedly until the object is expelled or the patient becomes unresponsive.

3. **For a child**, perform a subdiaphragmatic abdominal thrust (Heimlich Maneuver) until the object is expelled or the patient becomes unresponsive.

4. **For adults**, a combination of maneuvers may be required.
   a. First, subdiaphragmatic abdominal thrusts (Heimlich Maneuver) should be used in rapid sequence until the obstruction is relieved.
   b. If abdominal thrusts are ineffective, chest thrusts should be used. Chest thrusts should be used primarily in morbidly obese patients and in patients who are in the late stages of pregnancy.

5. If the patient becomes unresponsive, begin CPR immediately but look in the mouth before administering any ventilations. If a foreign-body is visible, remove it.

6. **Do not perform blind finger sweeps in the mouth and posterior pharynx. This may push the object farther into the airway.**

7. In unresponsive patients, Paramedics should visualize the posterior pharynx with a laryngoscope to potentially identify and remove the foreign-body using Magill forceps.

8. Document the methods used and result of these procedures in the EHR.
Definitions:
1. Supraglottic Airway Device (SAD): A device that is placed into the oral pharynx and subsequently placed over the glottic opening. This is done in a ‘blind’ maneuver without the aid of a laryngoscope. This will aid in the oxygenation and ventilation of the patient.
2. The I-Gel is the approved supraglottic airway device for Contra Costa County EMS.

Indications:
1. Cardiac Arrest
2. Respiratory arrest with no immediate reversible cause (i.e. hypoglycemia or opioid overdose)
3. Inability to adequately ventilate a patient with a Bag Valve Mask (BVM) and basic airway adjunct.
4. An unconscious patient without a gag reflex who is apneic or is demonstrating inadequate respiratory effort
5. For EMT's with approved optional scope: Patients greater than or equal to 15 years of age in need of airway protection or unable to be adequately ventilated with BVM.

Contraindications:
1. Gag reflex
2. Caustic ingestion – Esophageal burns
3. Known esophageal disease (e.g. cancer, varices or stricture)
4. Laryngectomy with stoma – if present, place ETT in stoma
5. Severe airway trauma
6. Trismus

Complications:
1. Airway and/or esophageal trauma
2. Regurgitation
3. Aspiration

Procedure:
1. Prepare, position and oxygenate the patient with 100% Oxygen.
2. Document the pre-intubation EtCO₂ reading.
3. Select proper I-Gel using weight based chart.
4. Lubricate the I-Gel with water-based lubricant, get suction ready.
5. If present, remove dentures or plates from the mouth prior to insertion.
6. Remove the I-Gel cradle and gently press the chin downwards and introduce the iGel into the mouth with the opening towards the chin, along the hard palate until a definitive resistance is felt. **Do not apply excessive force on the I-Gel upon insertion.**
7. Attach BVM, ETCO2 and ventilate the patient.
8. Auscultate for breath sounds and sounds over the epigastrium and look for the chest to rise and fall.

9. **Confirm tube placement using EtCO₂ and waveform capnography.** It is required that the airway be monitored continuously through waveform capnography (ALS providers) and pulse oximetry.

10. Secure I-Gel airway to patient with an approved method.

Clinical Indications:
1. Patient requiring intubation who has a mature stoma and does not have a replacement tracheostomy tube available.

Procedure:
1. Select the largest endotracheal tube (ETT) that will fit through the stoma without force; check the cuff and remove the stylette.
2. Pre-oxygenate the patient with 100% oxygen using a BVM.
3. Wear sterile gloves. It is not necessary to lubricate the ETT.
4. Suction if necessary.
5. Pass the ETT and inflate the cuff. The pharynx has been bypassed, so the ETT will protrude from the neck by several inches.
6. Hold the tube in place and attach the BVM.
7. While ventilating the patient, watch for equal rise and fall of the chest.
8. Secure the tube and ventilate with 100% oxygen.
10. Do not take longer than 30 seconds to perform this procedure.
11. Document ETT size, time, result (success) and placement location by the centimeter marks either at the stomal opening in the EHR. Document all devices used to confirm initial tube placement. Also document positive or negative breath sounds before and after each movement of the patient.
12. It is required that the airway be monitored continuously through waveform capnography (ALS providers) and pulse oximetry.
Clinical Indications:

1. Presence of Tracheostomy site.
2. Urgent or emergent indication to change the tube, such as obstruction that will not clear with suction, dislodgement, or inability to oxygenate/ventilate the patient without other obvious explanation.

Procedure:

1. Have all airway equipment prepared for standard airway management, including equipment for endotracheal intubation.
2. Have an airway device (endotracheal tube or tracheostomy tube) of the same size as the tracheostomy tube currently in place as well as 0.5 size smaller available (e.g., if the patient has a #6.0 Shiley, then have a 6.0 and a 5.5 tube).
3. Lubricate the replacement tube(s) with water-based lubricant and check the cuff.
4. Remove the tracheostomy tube from mechanical ventilation device and use a bag-valve mask to pre-oxygenate the patient as much as possible.
5. Once all equipment is in place, remove the device securing the tracheostomy tube.
6. If applicable, deflate the cuff on the tube. If unable to aspirate air with a syringe, cut the balloon off to allow the cuff to deflate.
7. Remove the tracheostomy tube.
8. Insert the replacement tube. Confirm placement via auscultation of the lungs.
9. If there is any difficulty placing the tube, re-attempt procedure with the smaller tube.
10. If difficulty is still encountered, use standard airway procedures such as oral bag-valve mask or endotracheal intubation. More difficulty with tube changing can be anticipated for tracheostomy sites that are immature (i.e. less than two weeks old). Great caution should be exercised in attempts to change immature tracheotomy sites.
11. Document the procedure, confirmation, patient response, and any complications in the EHR.
Clinical Indications:
Each and every out-of-hospital adult cardiac arrest (OHCA) which results in the activation of the EMS System shall be managed using CPR-Highly Defined (CPR-HD). CPR-HD is the expected standard of care for cardiac arrest in Contra Costa County.

Purpose:
The purpose of CPR-HD is to provide a structured, standardized and choreographed approach to cardiac arrest management. The CPR-HD ‘Script’ is time driven and serves as the ‘CODE’ leader.

Principles:
1. Resuscitation is based on proper planning and organized execution. Procedures require space and patient access. Make room to work. Utilize a team focused approach assigning responders to predetermined tasks.
2. The unit first on scene shall establish and follow the CPR-HD Script. Efforts should be dispensed to ensure adequate timekeeping occurs throughout the resuscitation.
3. Cardiac arrest management efforts should be directed at high quality and continuous chest compressions with limited interruptions. Our goal is to provide two (2) minutes of straight continuous compressions with a less than ten (<10) second pause.
4. In cardiac arrest, drugs are of limited usefulness. High quality compressions and defibrillation are far more important.
5. Conduct resuscitation with goal of preserving cerebral function through meticulous attention to procedure.
6. Passive ventilation for the first three cycles (6 minutes) of CPR. After that time, the patient should be ventilated using a BLS airway and BVM at a rate of 6 ventilations/minute (1:10 seconds) with continuous CPR. Placement of an advanced airway should be deferred unless a provider is unable to ventilate the patient with a BLS airway and BVM.
7. Once transport is deemed appropriate and the patient has experienced a return of spontaneous circulation (ROSC) at any time throughout the resuscitation; transport to a STEMI receiving Center.

*Amiodarone is only indicated in shockable rhythms refractory to three (3) shocks

***Early transport to a SRC is indicated under the following circumstances:
- Witnessed arrest with suspicion of pulmonary embolism; or
- V-Fib arrest resistant to four (4) shocks (refractory V-Fib).

**Termination of efforts:**
If non-shockable rhythm persists for 30 minutes despite resuscitative efforts, consider discontinuation of CPR

**Termination of efforts:**
- Naloxone for suspected OD only
- Sodium Bicarb or Calcium Chloride for renal failure or suspected hyperkalemia only

If indicated, contact the Base Hospital for order to terminate efforts

OPTIMAL CPR-HD MANAGEMENT
(If Fully Staffed)

First Arriving FMS Personnel
Should Assume These
Critical Positions First

Airway Two
Compression Two (A2/C2)

Airway One (A1)

Compression One (C1)

CPR Support Position

AED
Cardiac Monitor
Medication/Monitor One (M1)
Clinical Indications:
1. Imminent delivery with crowning.

Procedure:
1. Delivery should be controlled so as to allow a slow controlled delivery of the infant. This will prevent injury to the mother and infant.
2. Support the infant’s head as needed.
3. Check the neck for the umbilical cord. If it is present, slip it over the head. If unable to free the cord from the neck, double clamp the cord and cut between the clamps.
4. Suction the airway with a bulb syringe.
5. Grasping the head with hands over the ears, gently pull down to allow delivery of the anterior shoulder.
6. Gently pull up on the head to allow delivery of the posterior shoulder.
7. Slowly deliver the remainder of the infant.
8. Clamp the cord 2 inches from the abdomen with 2 clamps and cut the cord between the clamps.
10. The placenta will deliver spontaneously, usually within 5 minutes of the infant. Do not force the placenta to deliver.
11. Massaging the fundus may aid in the delivery of the placenta and decrease bleeding by facilitating uterine contractions.
12. Continue rapid transport to the hospital.
Clinical Indications:
1. CPAP is indicated in adult patients whom inadequate ventilation is suspected and who have adequate mental status and respiratory drive to allow CPAP to function. This could be as a result of pulmonary edema, pneumonia, asthma, COPD, etc.

Clinical Contraindications:
1. Decreased Mental Status.
2. Facial features or deformities that prevent an adequate mask seal.
3. Excessive respiratory secretions.

Procedure:
1. Ensure adequate oxygen supply to ventilation device.
2. Explain the procedure to the patient.
3. Consider placement of a nasopharyngeal airway.
4. Place the delivery mask over the mouth and nose. Oxygen should be flowing through the device at this point.
5. Secure the mask with provided straps starting with the lower straps until minimal air leak occurs.
6. If the Positive End Expiratory Pressure (PEEP) is adjustable on the CPAP device, adjust the PEEP beginning at 0 cmH₂O of pressure and slowly titrate to achieve a positive pressure as follows:
   a. 5 – 10 cmH₂O for pulmonary edema, near drowning, possible aspiration or pneumonia. A PEEP setting of 7.5 cm H₂O is suitable for most patients.
   b. 3 – 5 cm H₂O for COPD.
7. Evaluate the response of the patient assessing breath sounds, oxygen saturation, and general appearance.
8. Titrate oxygen levels to the patient’s response.
9. Encourage the patient to allow forced ventilation to occur. Observe closely for signs of complications. The patient must be breathing for optimal use of the CPAP device.
10. Document time and response in the EHR.
Clinical Indications:

1. Capnography shall be used when available with the use of all advanced airway procedures and as required by treatment guidelines.

Procedure:

1. Attach capnography sensor to the advanced airway or any other oxygen delivery device, including bag-valve mask and nasal cannula.
2. Note that EtCO₂ level and waveform changes. Values shall be documented in the EHR.
3. The capnometer shall remain in place and be monitored throughout prehospital care and transport.
4. Any loss of EtCO₂ detection or waveform may indicate an airway problem and should be immediately addressed and thoroughly documented.
5. Document the procedure and results in the EHR.

Notes:

1. EtCO₂ readings may be unreliable if the patient is in shock or has poor perfusion.
2. Normal EtCO₂ levels range from 35 – 45, but this may vary based on the patient’s underlying respiratory and metabolic status.
3. EtCO₂ levels that rise from a normal baseline to or above 40 generally indicates hypoventilation is occurring.
4. Patient stimulation, use of a BVM, or use of Naloxone may be appropriate based on the situation.
Clinical Indications:

1. Patients with symptomatic bradycardia (< 60/minute) with signs and symptoms of inadequate cerebral or cardiac perfusion such as:
   a. Chest Pain
   b. Hypotension
   c. Acute onset of pulmonary edema
   d. Altered Mental Status
   e. Seizure

Procedure:

1. Attach cardiac monitor using standard four-lead placement.
2. Apply defibrillation/pacing pads to chest and back:
   a. One pad to left mid chest next to sternum.
   b. One pad to mid left posterior chest next to spine.
3. Select pacing option on monitor unit.
4. Adjust the heart rate to 60 BPM for an adult.
5. Note pacer spikes on ECG screen.
6. Slowly increase output until capture of electrical rhythm on the monitor.
7. If unable to capture while at maximum electrical output, stop pacing immediately.
8. If capture observed on monitor, check for corresponding pulse and assess vital signs.
9. Consider the use of sedation or analgesia if patient is uncomfortable.
10. Document the dysrhythmia and the response to external pacing with ECG strips in the EHR.
Clinical Indications:
1. Helmet interferes with airway management or spinal motion restriction.
2. Improper fit, allowing head to move within helmet.

Contraindications:
1. Airway and spinal motion restriction can be addressed without helmet removal.

Procedure:
1. High Impact Helmets (e.g. motorcycle, car racing) - Whether the helmet is a closed or open-faced style helmet, the helmet must always be removed while providing spinal precautions.
2. Low Impact Helmets with Shoulder Pads (e.g. football, ice hockey, etc.) - In those patients wearing a well-fitted helmet which conforms closely to the patient's head, it may be preferable to leave the helmet and shoulder pads in place after removing the face mask. If the helmet is removed, the shoulder pads must also be removed to maintain neutral spinal alignment.
3. Low Impact Helmets without Shoulder Pads (e.g. baseball, bicycle, rollerblade, etc.) - Whether the helmet is a closed or open faced style helmet, the helmet must always be removed while providing spinal precautions.
4. Assess and document PMS.
5. While gently removing the helmet, maintain stabilization of the cervical spine. If indicated, place the patient in spinal motion restriction.
6. Reassess and document PMS.
Clinical Indications:

1. Patients where rapid, regular IV access is unavailable with any of the following:
   a. Cardiac arrest
   b. When IV access is unsuccessful or, after evaluation of potential sites, it is determined that an IV attempt would not be successful in the setting of:
      i. Shock or evolving shock, regardless of the cause.
      ii. Impending arrest or unstable dysrhythmia.

Contraindications:

1. Fracture of the targeted bone.
2. IO within the past 48 hours in the targeted bone.
3. Infection at the insertion site.
4. Burns that disrupt actual bone integrity at the insertion site.
5. Inability to locate landmarks or excessive tissue over the insertion site.
6. Previous orthopedic procedure near the insertion site (e.g. prosthetic limb or joint).

Procedure:

1. Proximal humerus (preferred site in patients with perfusing rhythm)
2. Proximal tibia
3. Distal tibia (if proximal humerus or proximal tibia are unsuitable)

Procedure:

1. Locate the insertion site:
   a. The proximal humerus site is the greater tubercle, identifiable as a prominence on the humerus when the arm is rotated inward and the patient's hand is on the abdomen.
   b. The proximal tibia site is on the flat medial aspect of the tibia, 2 finger-breadths below the lower edge of the patella and medial to the tibial tuberosity.
   c. The distal tibia site is 2 finger-breadths above the most prominent aspect of the medial malleolus (inside aspect of ankle) in the midline of the shaft of the tibia.
2. Prep the selected site with chlorhexidine and allow to air dry.
3. Select and load the appropriate sized needle on the driver.
   a. For humeral access, a 45mm (yellow) needle is used except in patient adults less than 40kg.
   b. For proximal and distal tibial access, the amount of soft tissue should be gauged to determine if a 25mm (blue) or 45mm (yellow) needle is appropriate.

4. Introduce the IO needle through the skin without engaging the power driver:
   a. For humeral access, the direction of the needle should be perpendicular to the skin, directed at a downward angle of 45 degrees from the frontal plane, heading slightly downward toward the feet.
   b. For tibial sites, the direction of the needle should be at a 90 degree angle to the flat surfaces of the tibia.

5. Once the needle has touched the bone surface, assess to see if the black line on the needle is visible. If it is not visible, either a larger needle is needed, or in the case of the 45mm needle, the soft tissue is too thick to allow the use of that needle.

6. With firm pressure, insert needle using the power driver. In most cases, the hub should be flush or touching the skin. Verify that the needle is firmly seated in the bone; it should not wobble.

7. Remove the stylet and introduce Lidocaine if the patient is not in arrest.
   a. For adult patients not in arrest, 40mg of Lidocaine should be infused slowly over 1-2 minutes and allow 1 additional minute before flushing.
   b. For patients in arrest, Lidocaine is not necessary but may be needed if the patient regains consciousness.

8. Flush with 10ml Saline. In conscious patients, flush with 5ml Saline initially and repeat if necessary.

9. Attach stabilizer to skin.

10. Attach IV tubing to IO hub and begin infusion using pressure bag.

11. If painful, an additional 20mg of Lidocaine can be infused over 30 seconds, and after another minute, infusion should be restarted.

12. Monitor site for swelling or signs of infiltration and monitor pulses distal to area of placement.

13. Place wristband included with IO set on patient.
Clinical Indications:

1. Patients who are exhibiting signs of a tension pneumothorax and have at least one of the following signs:
   a. AMS
   b. Hypotension
   c. Increased pulse and respirations
   d. Absent breath sounds or hyperresonance to percussion on affected side
   e. Jugular vein distension
   f. Difficulty ventilating
   g. Tracheal shift
   h. In patients with penetrating trauma to the chest or upper back, or gunshot wound to the neck or torso who are in respiratory distress, a weak or absent radial pulse may be substituted for blood pressure measurement as listed above; signs of tension pneumothorax listed above may also be present.
   i. Patients in traumatic arrest with chest or abdominal trauma for whom resuscitation is indicated. These patients may require bilateral chest decompression even in the absence of the signs above.

Procedure:

1. Administer high flow oxygen.
2. Identify and prep the site:
   a. Locate the second intercostal space in the mid-clavicular line on the same side as the pneumothorax.
   b. Prepare the site with chlorhexidine and allow to air dry.
3. Insert a 14g catheter into the skin over the third rib and direct it just over the top of the rib (superior border) into the interspace.
4. Advance the catheter through the parietal pleura until a “pop” is felt and air or blood exits under pressure through the catheter, then advance catheter only to chest wall.
5. Remove the needle, leaving the plastic catheter in place.
6. Secure the catheter hub to the chest wall with an Asherman chest seal. The catheter should be stabilized within the flutter valve mechanism.
Clinical Indications:
1. Any child that can be measured with the Peditape.

</table>
Clinical Indications:
1. Suspicion of spinal or neurological injury

Procedure:
1. Have the patient extend both wrists and touch each finger to its thumb.
2. Have the patient flex each foot upward and down.
3. Ensure the patient has gross sensation in all extremities. Note any deficits.
4. Explain to the patient the actions that you are going to take when assessing the spine. Ask the patient to immediately report any pain verbally by answering questions with a verbal "yes" or "no" answer rather than shaking the head.
5. With the patient’s spine supported to limit movement, begin palpation at the base of the skull at the midline of the spine.
6. Palpate the vertebrae individually from the base of the skull to the bottom of the sacrum.
7. On palpation of each vertebral body, look for evidence of pain and ask the patient if they are experiencing pain. If evidence of pain along the spinal column is encountered, the patient should be immobilized.

Risk Assessment:
1. History of high-velocity blunt injury increases spinal injury risk.
2. Axial load injury to the head (e.g. diving) increases spinal injury risk.
3. Low-velocity injuries such as falls from a standing position or lower-velocity motor vehicle accidents have increased risk in patients 55 and older.
Clinical Indications:
1. Spinal motion restriction (SMR) as determined by spinal injury assessment.
   a. Blunt trauma – full SMR (C-collar and full-length vacuum splint):
      i. Major blunt trauma meeting trauma activation criteria
      ii. Presence of neurological deficit, priapism or suspected spinal shock
      iii. Obvious anatomic deformity of the spine
      iv. Significant tenderness on palpation of vertebral column
      v. Significant blunt trauma mechanism when a patient assessment is unreliable
   b. Blunt trauma – modified SMR (C-collar only):
      i. Blunt trauma not meeting above criteria but with pain complaints or concerns based on mechanism or patient risk
      ii. Examples of patients may include those ambulatory after self-extrication, low-velocity mechanisms and those with no neurologic findings.
   c. Penetrating trauma – full SMR:
      i. Neurologic deficit or an obvious deformity of the spine
      ii. Patients who have both penetrating and a significant blunt injury should be evaluated using blunt trauma criteria

Procedure:
1. Explain the procedure to the patient; assess and record extremity neuro status & distal pulses.
2. Place the patient in an appropriately sized C-collar while maintaining in-line stabilization of the cervical spine by a second provider.
3. If indicated, place the patient on a full-length vacuum splint.
4. Stabilize the patient with straps and head rolls or other similar device. Once the head is secured, the second provider may release manual in-line stabilization.
5. Assess and record extremity neuro status and distal pulses post-procedure. If worse, remove any immobilization devices and reassess.

Note:
1. SMR should reduce, rather than increase, patient discomfort. SMR that increases pain should be avoided. The cervical spine should never be moved if movement increases pain or in the presence of neurological deficits or neck spasms.
2. Suspected spinal injuries should be maintained in a neutral position; position will vary by patient.
3. Routine use of full spinal motion restriction should be reserved for patients with confirmatory physical findings or high suspicion of spinal injury.
4. AMS or presence of an entry/exit wound in proximity of spine are no longer indications for SMR.
Clinical Indications:
1. Taser darts incurred from law enforcement intervention that are impeding patient care or are causing profound discomfort for the patient may be removed.
2. Do NOT remove a taser dart that is located in the face, neck, or groin.

Procedure:
1. Assess the patient for any potential injury after the taser was deployed. Note that taser deployment will cause a patient to fall to the ground.
2. When safe to do so, verify that all wires of the taser dart have been disconnected from the weapon.
3. Place one hand on the patient in the area where the taser dart is embedded and stabilize the skin surrounding the puncture site between two fingers. Keep your hand away from the taser dart.
4. With your other hand, in one fluid motion, pull the taser dart straight out from the puncture site.
5. Immediately dispose of the taser dart in an approved sharps container.
6. Apply direct pressure for bleeding and apply a sterile dressing to the wound.

Note:
1. Patients who have had taser darts removed shall not be medically cleared by prehospital personnel.
2. The following must be documented in the EHR:
   a. The patient’s presenting behavior or signs/symptoms which lead to law enforcement to tase the patient.
   b. Time of taser dart removal.
   c. Anatomic location of taser dart.
   d. Whether or not the taser dart was intact following removal.
Clinical Indications:
1. Life threatening extremity hemorrhage that can not be controlled by other means.
2. May be appropriate for use to control hemorrhage in multi-casualty incidents.

Contraindications:
1. Non-extremity hemorrhage.
2. Hemorrhage that can be controlled with pressure or dressings.

Procedure:
1. Place tourniquet proximal to wound.
2. Tighten until hemorrhage stops or distal pulses in affected extremity disappear.
3. Secure the tourniquet and mark the time of application on extremity.
4. Note the time of tourniquet application in the electronic medical record and communicate this to the receiving facility.
5. Dress wounds as necessary.
6. If one tourniquet is not sufficient or not functional to control hemorrhage, consider the application of a second tourniquet more proximal to the first.
Clinical Indications:

1. Clinically stable patient with narrow complex tachycardia. Do not attempt this procedure on a patient with serious signs or symptoms, which include: Hypotension; acutely altered mental status; signs of shock/poor perfusion; chest pain with evidence of ischemia (e.g. STEMI, T-wave inversions, or depressions); and acute CHF.

Procedure:

1. Place the patient on a cardiac monitor; ensure continuous ECG monitoring throughout procedure.
2. If not already completed, establish intravenous access.
3. Describe the procedure to the patient.
4. Place and position the patient on the gurney so that the patient is sitting in a semi-recumbent (45°) position.
5. Have the patient inhale and hold his/her breath while bearing down as if to have a bowel movement, or have the patient blow into a 10ml syringe while pinching their nose closed. Instruct the patient to continue bearing down or blowing into the syringe until told to stop; time the event for 15 seconds.
6. Immediately lie the patient supine and elevate the patient's legs to 45° for 15 seconds.
7. Lower the patient’s legs such that the patient is in a supine position and reassess the cardiac rhythm after 45 seconds.
8. Continue to monitor the heart rhythm during the procedure. Stop the procedure if the patient becomes confused, the heart rate drops below 100 or asystole occurs.
9. If the patient remains in a narrow complex tachycardia, repeat the procedure one time.
10. Document the initial and all subsequent ECG rhythms and any dysrhythmia in the prehospital care record.
Clinical Indications:

1. Any patient where intravenous access is indicated (significant trauma, emergent, or potentially emergent medical condition) for fluid or medication therapy.

Procedure:

1. Saline locks may be used as an alternative to an IV tubing and IV fluid in every treatment guideline at the discretion of the ALS provider.
2. Paramedics can use intraosseous access where threat to life exists as provided for in the Intraosseous procedure.
3. Use the largest catheter necessary based upon the patient’s condition and size of veins.
4. Select the most appropriate site:
   b. Antecubital – Preferred site for patients in shock, cardiac arrest, who will receive Adenosine, or when a peripheral site is not available.
   c. Intraosseous (IO) – Preferred site for critical patients where IV access was unsuccessful or are in cardiac arrest.
   d. External Jugular (EJ) – Unstable patients who need emergent IV medications or fluids AND no peripheral site is available AND IO access is not appropriate (e.g. very alert patient).
5. Inspect the IV solution for expiration date, cloudiness, discoloration, leaks, or the presence of particles.
6. Connect IV tubing to the solution in a sterile manner. Fill the drip chamber half full and flush the tubing, thus bleeding all air bubbles from the line.
7. Place a tourniquet around the patient’s extremity to restrict venous flow only.
8. Prep the skin with chlorhexidine and allow to air dry.
9. Insert the needle with the bevel up into the skin in a steady, deliberate motion until a blood flashback is visualized in the catheter.
10. Advance the catheter into the vein. Never reinsert the needle through the catheter. Dispose of the needle into a sharps container without recapping.
11. Remove the tourniquet and connect the IV tubing or saline lock.
12. Open the IV to assure free flow of the fluid and then adjust the flow rate as clinically indicated.
Patient Safety is medication administration is paramount. Accurate administration of pediatric medication requires multiple steps. Follow each of the steps below in every case.

Clinical Indications:
1. Any patient under 15 years of age that requires a medication intervention.

Procedure:
1. Assess Patient
   - Use the 6 RIGHTS – Right patient, Right drug (and indication), Right dose, Right route of administration, Right timing and frequency, and Right documentation.

2. Obtain weight estimate in Kilograms
   - Use the Pediatape measurement device in every child of appropriate height to determine color range of weight. Pediatape applies to patients less than 147 cm tall (4 foot, 10 inches).
   - If taller than the Pediatape tape, estimate weight by patient/parent history or paramedic estimate and ALWAYS convert to kilograms using conversion table.

3. Determine volume on Drug Chart
   - Consult drug chart based on medication name to determine volume in ml.
   - If patient is 50 Kg or greater, utilize adult dosages.

4. Draw up medication
   - Verify drug being administered.
   - Utilize smallest syringe for volume (e.g. 1 ml or less, use tuberculin syringe).
   - When giving IM or intranasal medication, load syringe ONLY with amount to be administered.

5. Double check to confirm volume
   - Double-check volume and dose with drug chart in hand – verbalize name of medication, volume, dosage and route to another paramedic or trained EMT on scene. If possible, have another provider visually confirm dose in syringe and as called for on drug card.

6. Administer Medication
   - Administer medication by appropriate route.
   - Observe the patient for signs of an adverse reaction.

7. Documentation
   - Always document dosages in your patient care report by milligrams (or if Dextrose, in grams).
   - Document response to medication and any observed adverse reaction.
Clinical Indications:
1. Suspected diabetic patient
   a. Signs and symptoms may include, altered mental status, combative or irritable, diaphoresis, seizure, abdominal pain, nausea or vomiting, weakness, dehydration, deep or rapid breathing
   b. Medical bracelet found, insulin or other diabetic medications found, information received from patient and bystanders
2. Decreased LOC with unknown origin

Contraindications:
1. None

Equipment:
1. PPE
2. Glucometer
3. Alcohol prep pads
4. Blood glucose test strips
5. Lancet & band-aid
6. Sharps container

Procedure:
1. Activate 9-1-1 if not already activated
2. Assess patient to confirm indications are met
3. Insert test strip into glucometer
4. Cleanse finger with alcohol prep
5. Gently massage finger to promote blood flow and pierce with lancet
6. Apply blood sample to blood strip and document results
7. If BGL glucometer reading is < 60 follow treatment guideline for administration of oral glucose.
8. Continue to monitor, reassess and treat patient

Special Considerations:
1. Glucometer manufacturer instructions should be included in all Agency specific training

Treatment Guidelines:
1. Adult: G01, A03, A05, A07, A08, A12, A13, A16, A17, A18, A19, A20, T08
2. Pediatric: PC01, PC04, P03, P04, P05, P06, P07, P09, P12, P13
Clinical Indications:
1. Patient exposed to allergen and displays **systemic** signs and symptoms such as:
   a. **Mental status**: Anxiety, sense of impending doom, confusion, unconscious
   b. **Onset**: Sudden, but can be more than an hour after exposure
   c. **Skin/vascular system**: Severe flushing, rash or hives, edema to the face and neck
   d. **Respiration**: Severe bronchoconstriction (wheezing), laryngospasm (stridor), difficulty breathing
   e. **GI system**: Severe cramps. Abdominal rumbling, diarrhea, vomiting
   f. **Vital Signs**: Early signs include increased heart rate and respiratory rate. Late signs included falling respiratory rate and blood pressure, shock

Contraindications:
1. Use caution with patients who are >50 years of age and patients with cardiac history
   a. Patients >50 years of age should receive pediatric dose (0.15 mg)

Equipment:
1. PPE
2. Epinephrine auto-injector (adult and pediatric)
3. Alcohol prep pads
4. Sharps container

Procedure:
1. Activate 9-1-1 if not already activated
2. Assess patient to confirm indications are met
   a. Remove allergens
   b. Manage life threats, airway, breathing and circulation
3. Consider aseptic technique if appropriate
4. Administer appropriate epinephrine auto-injector (record time of administration)
   a. **Adult auto-injector**: 15 through 49 years of age
   b. **Pediatric auto-injector**: 0 through 15 years of age and > 50 years of age
5. Continue to monitor, reassess and treat patient
   a. Be ready to support ventilations
   b. Secondary administration should be via IV route by a Paramedic

Special Considerations:
1. Manufacturer instructions should be included in all Agency specific training

Treatment Guidelines:
1. A04, P02
Clinical Indications:
1. Patient >22 kg. (50 lbs.)
2. Patient with suspected narcotic overdose and inadequate breathing (respiratory rate <8). Signs and symptoms include:
   a. Deep snoring or gurgling
   b. Pale and or clammy skin
   c. Depressed LOC, no response to stimulation, heavy nod
   d. Pinpoint pupils

Contraindications:
1. Patient is breathing adequately and able to maintain own airway
2. Relative contraindication for allergy to naloxone
3. Not advised when patient has exercised their right under the California End of Life Act, are on hospice or who are newly born

Equipment:
1. PPE
2. Naloxone prefilled syringe (pre-load or auto-injector)
3. Nasal atomizer (pre-load)
4. Alcohol prep pads
5. Sharps container

Procedure:
1. Activate 9-1-1 if not already activated
2. Assess patient to confirm indications are met
   a. Manage life threats, airway, breathing and circulation
3. Administration of naloxone should be titrated to effect adequate breathing not to restore consciousness.
4. Consider aseptic technique if appropriate
5. Administer naloxone intranasal (Record time of administration)
   a. Attach nasal atomizer
   b. Administer 1 mg / 1mL into each nostril
6. Prepare for patient to vomit; utilize recovery position and suction
7. Continue to monitor, reassess and treat patient

Special Considerations:
1. Manufacturer instructions should be included in all Agency specific training

Treatment and Field Procedure Guidelines:
1. G02, G03, A13, A14, P08, P09, P10, FP09
Clinical Indication:
- Bleeding that is not controllable with the use of a tourniquet or where tourniquets are not indicated (e.g. head, neck, trunk, etc.)

Contraindications:
- Wounds involving exposed organs (e.g. bowels)
- Sucking chest wounds
- Injuries to the eye and airway

Procedure:
1. Expose the injury by opening or cutting away the patient’s clothing.
2. If possible, remove excess blood from the wound while preserving any clots that may have formed.
3. Locate the source of the most active bleeding.
4. Remove the hemostatic dressing from its sterile package and pack it tightly into the wound directly over the site of the most active bleeding (more than one dressing may be required to achieve hemorrhage control).
5. Apply direct pressure quickly with enough force to stop the bleeding, holding direct pressure for a minimum of 3 minutes.
6. Reassess for bleeding control
7. More dressing may be packed into the wound as necessary to stop any continued bleeding.
8. Secure the hemostatic dressing in place with compression bandage or roller gauze.

Treatment and Field Procedure Guidelines:
1. T04, T05, T06

Contra Costa County Emergency Medical Services

Influenza and COVID-19 Vaccination

Field Procedure FP29

Page 1 of 2

Equipment required
1. Vaccine
2. 23-25 g, 1-inch needle
   a. For larger patients, 1.5-inch needle length may be more appropriate.
   b. See “Needle Gauge/Length and Injection Site Guidance” below for additional information.
   c. COVID-19 vaccine may come as prefilled/ready to administer or require other injection supplies or sizes.

Vaccine Administration Procedure
1. Assess the need for the vaccine in question utilizing the current guidance on that vaccination.
2. Screen for contraindications and precautions of inactivated vaccine (listed below).
3. Collect and review Vaccine Consent/Record of Administration sheet
   a. Confirm that the consent has been signed.
4. To prevent syncope, vaccinate patients while they are seated or lying down and consider observing them for 15 minutes after receipt of the vaccine.
5. Paramedics must maintain aseptic technique when administering the influenza or COVID vaccines.
6. The screening questionnaire must be completed prior to administration of the influenza or COVID vaccine.
7. Wash hands and don gloves.
8. Check expiration date of vaccine.
9. Cleanse the area of the deltoid muscle with the alcohol prep.
   a. Deltoid landmarks: 2-3 finger widths down from the acromion process; bottom edge is imaginary line drawn from axilla
10. Insert the needle at a 90-degree angle into the muscle.
    a. Pulling back on the plunger prior to injection is not necessary.
11. Inject the vaccine into the muscle.
12. Withdraw the needle, and using the alcohol prep, apply slight pressure to the injection site.
13. Do not recap or detach needle from syringe. All used syringes/needles should be placed in puncture-proof containers.
14. Monitor the patient for any symptoms of allergic reaction.
15. Document the following information:
    a. Date of vaccination
    b. Name of patient
    c. Injection site
    d. Vaccine lot number
    e. Vaccine manufacturer
16. Complete appropriate documentation:
   a. **Vaccine Consent/Record of Administration form**: ensure this is completed, retained and appropriately submitted after administration.
      i. Note that medical records/charts should be documented and retained in accordance with applicable state laws and regulations. If vaccine was not administered, record the reason(s) for non-receipt of the vaccine (e.g., medical contraindication, patient refusal). Discuss the need for vaccine with the patient (or, in the case of a minor, their parent or legal representative) at the next visit.
   b. **Vaccine Information Statement**: document the publication date and the date it was given to the patient.
   c. **Patient’s medical record**: if accessible, record vaccine information (above) in the patient’s medical record.
   d. **Personal immunization record card**: record the date of vaccination and name/location of administering clinic.
   e. **Immunization Information System (IIS), or “registry”**: Report the vaccination to the appropriate state/local IIS, if available.
   f. **VAERS**: report all adverse events following the administration of a vaccine to the federal Vaccine Adverse Event Reporting System (VAERS)
      i. To submit a VAERS report online (preferred) or to download a writable PDF form, go to [https://vaers.hhs.gov/reportevent.html](https://vaers.hhs.gov/reportevent.html). Further assistance is available at (800) 822-7967.

17. Give patient vaccine information sheet, using the appropriately translated sheet for non-English speaking client; these can be found at [www.immunize.org/vis](http://www.immunize.org/vis).

19. Advise patient when to return for subsequent vaccination, if appropriate.
